The Third Great Advance

During the war, human technology advanced at the rate man is capable of attaining, instead of the slow rate man usually is willing to attain. In four years, science made strides that would under the lesser stimuli of normal times, have reonired at least one, and in many instances four decades. Radar, and nuclear physics, are the best-publicized advances-the two really new technologies. (Radar is not new to science: Hertz demonstrated it way-back-when. Nuclear energy isn't new to science; the Cockcroft-Walton experiment in 1931 released the nuclear energy of the lithium atom by atomic fission under hydrogen bombardment. But neither had been accomplished on a technological-engineering-level.)

of course-war invariably does that. It's one of the insanities of man that war, in the long run, saves for more lives than it consumes. Man is just stunid enough to limit the life-saving efforts of medicine in normal times in such a way that only in war can the great advances be made. It isn't that war is necessary to produce those advances; it's just that only during war do men try hard enough to make them. Those advances will during the

next ten years, save more fives. save more human misery, in the United States alone than all the destruction of war cost us. It's Man's own fault we have war-and it's Man's own fault that only during war do we learn how to protect life.

But such advances as medicine developed are additions to known fields, not the opening of new fields. There is a third great field of advance that has been practically unmentioned in general magazines. The third great discovery, like radar and nuclear physics, is the engineering development on a tremendous scale of a minor, halfforgotten laboratory fact. This third item has been mentioned before in Astomding-the develop-Medical science advanced greatly. ment of silicone chemistry. Basically, silicone chemistry embraces the general field of complex chaincompound molecules, resembling the molecules of organic chemistry, but based on silicon dioxide instead of being based on carbon. They are not, accurately speaking, based on silicou, the element, instead of carbon, but on silicon dioxide, the compound, instead of carbon. There are many compounds based on silicon known, but these are called silicides, rather than silicones, and they are completely unstable in an environment containing water and

oxygen. The silicones, on the other hand, are inherently far more stable to an environment containing water and oxygen than are the carbonbase organic compounds. Silicone rubber resembles natural rubber in nearly every way-but unlike carbon-based rubber, either natural or synthetic, the silicone rubber is mmune to exidation by air either when exposed to the ultraviolet of sunlight, or at temperatures well above the boiling point. Synthetic plastics based on silicone instead of carbon have been made; they resist heat and air far better than carbonbased materials. White enamels based on these silicone plastics can stand oven heats in a way no carbon plastic can, without discoloring or yellowing. Ultraviolet light has no effect, and age means far less to

them. The silicone chemistry is an enormous field of development, not simply a special development of a few special compounds. If there is a carbon-based material, it can probably be represented by a similar, but more stable, silicone based substance. There are silicone rubbers, oils, waxes, greases, plastics. varnishes, and so on already. What will be developed in the future remains unknown. But already these highly valuable compounds have been developed, and will begin appearing on the civilian market soon.

There is a silicone insulating fluid that is so excessively "wet" that it can be applied to a piece of metal, cloth, or the like which is covered with water. It will get under the film of water, wet the metal or other solid immediately, and exclude the water from contact. Sprayed on on automobile engine that is "drowned out," it will force the water off the ignition cables, spark olues, and motor block, and form an insulating layer. The engine then starts immediately. Another member of the same family will, when put on unglazed porcelain, permanently prevent the formation of a film of water that would shortcircuit or weaken by partial shorting, the high frequency currents

Then there is an automobile libricant oil that, unlike carbon-base oils, will not oxidize to form sludge, or varnish on the bearings. That alone would be an immense improvement. But in addition, there will be no need for summer and winter grades; the silicone oil flows with the same case and fluidity in —40° temperatures as at 70°, and remains unchanged at 180°, above

used in radio.

There are equally remarkable waxes and greases now known. The field of silicone chemistry, like the field of nuclear physics, has only opened up. In its own way it is almost equally promising.

THE EDITOR.

The Nightmare

by CHAN DAVIS

This is a story of the immediate tomorross—and of civilination headed down the inescapable road to destruction—down the road that we have, already, selected—and its nightmare end.

Rob Ciccone bent down, picked up the bottle of milk outside the door of his apartment, and started to pick up the paper beside it. When he saw the beaddine that topped two columns on the left-hand side of the front page, he hesitated. Then he stood up and wiped his forehead.

The morning newspaper is essentially a simple, ordinary, and familiar thing. It's a habit. But it THE NIGHTMARE

doesn't seem quite so ordinary and familiar when you see your name in black type at the top of page

one. Rob picked up the paper and went hack into the flat to read it. With forced deliberation be slowly sat down in the most relaxing chair available and spread the paper carefully before starting the article. He was worried. As far as he knew there was no reason for him to be on page one. He did not helong there. He had, to be sure, been one of the speakers at the S.N.P. chapter meeting last night, but he had been planning to look for that write-up on page twenty-six or thereabouts. Worse, Rob's job was one of those in which you do not make page one in the New York Diseatch, or any other paper, un-

less it is bad news, and very bad.

He began to read, then the worry
gave way to puzzlement. It was
the report of the meeting after all,
and carried, as he had expected,
the by-line of his friend Creighton
Macomb. It ran:

Ciccone Flays City's Geiger Search Policy; Warns Peril Grows

Dr. Robert A. Ciccome, chief of the Broux Sector Radinactive Search Commission, stated last night that the present system of Geiger-consters search would not be adequate for the prevention of an area. Addressing the Broux Chapter of the Society of Nuclear Physiciats, he said! "No number of successes in preventing the importing of dangerous radioriality, and If foul madde to state posificility, and If foul madde to state posi-

tively that failure, and disastrous failure, is impossible."

So far so good, thought Rob. At least they were quoting directly, Of course the sentence quoted was the most outspoken of the whole thing; it read like a much stronger attack on the search program than he had actually dared to make. But the same thing had been said

before by others. Ten years before, when the Geiger search had first been brought up as a counterproposal to the Compton plan of decentralization, the whole subject had been batted back and forth in the press. Opponents of the search system, himself included, had claimed that New York was a situ ting target for an atomic bomb, that no preventive measures could change that fact, and that the only answer to the danger was to scatter New York's industries and commerce over as wide an area as possible. The other party had poohpoohed this warning, pointing to the U.N.O. Security Council's strict supervision of all the world's piles. and to the greatly improved methods

had thought his speech would be played down, interpreted as a suggestion that search methods be improved. Instead—this. Why? He read the remainder of the article hurriedly. It was O.K. Accurately reported, without editor-

for the detection of radioactives.

Finally, the second party had won.

And since that time even the most

extreme alarmists had been given

less and less newspaper space. He

ializing. But it didn't answer his

question.

He thought of calling Crate Macomb, but looked at his watch and
decided he'd have to wait. All
through dressing, shaving, and
breakfast, he was too prescuing, and
breakfast, he was too prescuing, and
breakfast, he was too prescuing, and
prescribed to the company of the company

were not thought intochata.

At 8:15, when he was ready to leave for work, he dialed the Dispatch, gave an extension number. "Could I speak to Macomb? That

you, Crate?"
"Yeah. Hello, Rob." Macomb

"I...er... I just called up to congratulate you on making the front page. Congratulate myself, too, of course."

"Congratulate--!" He sounded puzzled.

anything else.

"That terrific billing I got in the paper this morning. I've got to admit I don't understand it. New editorial policy?"
"Oh, I get it. You've only seen the home edition, not the later edi-

"That's right. What have the

"That's right. What have the later editions got?"
"Well. I'll tell you the whole

thing." He dropped his voice.
"The City Ed and I have been
against this Geiger system right
along, and looking for chances to

his slip through stories slanted against it."

Ia
"I thought you gave that up."

"I gave up bucking editorial polsy openly, because it wasn't healthy, but I thought I'd take a chance on this story. The City Ed got it past His Nibs without too much rostble, it made the first edition, O.K., and we thought the thing would come off. But—"

usual, for normally results that "Yeah, but. I knew that was were not thoroughly innocuous coming. What about those later were enough to take his mind off editions?"

"That's the catch, all right. You remember what you told me last might before the meeting? About the aerial radioactivity your boys found over the Bronx yesterday?"
"You didn't let that into print,

did you?"
"I didn't, no. I know well enough that radioactivity in the air might be either chance air currents

from the Osvego pile, or hidden radioactives around the city, and whichever it is I know darm well that telling the people about it right away is the worst thing to do. Even if I had submitted copy on it, I wouldn't have expected it to get past the editor. But some cub reporter got the dope from the man who took the aerial tests, and didn't now any better than to ashmit it."

"And they ran it."

"And they ran it, yes." Crate paused, and said slowly: "They ran it in the same article with a rewritten version of what you read in the first edition."

"I can imagine. . . His Nibs couldn't recall the edition that fea-

tured my statement, so he set out to discredit me."
"That's it. It could be much

"That's it. It could be much worse." Crate's tone of voice indicated what he meant. He meant, "Probably it will be much worse."

Rob stopped to let the implications sink in. Finally, "Has the news-started a panic in the Bronx? The news of the tests, I mean."

"Not yet. Look, Rob. His Nibs doesn't know I was responsible for the slant in the original offense this morning; he's blaming it on the City Ed. He doesn't know I know yon personally, either. He does know I graduated in nuclear physics. So he's assigning me to—write a feature on you. Not a battleton."

"Whew- So?"

"So I'll have to do the best I can. So I'd appreciate it if I could see you some time soon and talk the whole thing over. I can tell

you more then."

That certainly seemed to be in order, to put it mildly. Rob named a cafeteria near the Dispatch Build-

ing, promised to be right down, and rang off.

On his way to the subway station he picked up a Dispatch. He was still on the front page, and, as Crate had indicated, the treatment of him was rather different. He had not merely addressed the Society of Nuclear Physiciats; in this edition he had done much more decition he had done much more control of the property o

A-bomb was bring assembled some-

where in his sector, although his search groups had failed to detect the importing of the bomb materials. It was hinted that the reason he had stressed, in his speech, the impossibility of adequate searches, was to cover up his own incompetence when news of his failure broke.

The shir, he reflected, would job was not political, and if he were incompetent no amount of fast talking would help him. Conversely, the press couldn't hurt him, outside of discrediting is statement. Still, you had to be careful not to underseit and the still have been supported in the statement of the control of the c

estimate the power of the press. The other angle was much more important. Suppose the paper's first charge were right. Suppose that yesterday's test results had been more than chance, and start proper of building a bomb, radioactives really had been sunuggled into his sector. He wouldn't try to guess who might be doing it; he didn't know obition.

But the thing was possible. Well? Before meeting Crate, he slipped into a phone booth and held a conversation—consisting chiefly of code phrases—with the Bronx Sector headquarters. When it was done he lurried into the cafeteria and souted Macomb. He asked abruptly,

"Your car in town today?"
"Yes, it is."
"The usual parking let?"

"Yeah."
"Good. We'd better go uptown right away." Macomb came with-

"I just phoned Charlie. They're state the bit stronger, and consistent. The wind's clauged to east, and the metorologist says if the reading-keep coming this way another bear there's no chance that it's a fall-calarm. They really should have got in tooth with me earlier, but as it is I'll have to get there as quickly

as I can."
"This takes precedence over
everything else, all right."

"It takes precedence over just about anything in the whole city, if it's not a false alarm. Anyhow," is also as they climbed into the car, "you're not skipping out on your assignment. If you're going to succeed in getting a story on my incompetence, here's your chance, and I certainly hope I disappoint you."

They cut west toward Riverside Drive, Macomb at the wheel. When they were on the Drive, Ciccome asked suddenly, "Who runs the Dispatch, anyway?"
"The Ed does a pretty fair job."

"Yes, but . . . you told me once the Ed takes orders from somebody."

The other laughed. "Things aren't as simple as that in the newspaper racket. Nobody gives orders. But if any one man deter.

mines the policies of the paper, I guess it's Ellsworth Bates." Ellsworth Bates. Ciccone ran over in his mind what he knew of the man. Bates was not, to the public, a prominent name. On the society page it was inconspicuous. In political news, the name celding

appeared. Even in business news it ordinarily occurred only in listings of corporation boards. Yet apparently behind the scenes this Bates was a power; Macomb certainly should know.

tainly should know.
"I was thinking," Rob went on.
"Suppose for a minute a bomb is
being assembled, and suppose Bates
is connected with it. Wouldn't that
explain what happened this morn-

ing?"
"Why-"

"First, he may succeed in contusing our sector organization by slinging mud at me. Second, he may confuse the whole borough by starting a panic. Third, he would surely jump on anything that might talk the public into decentralization in he'd want the city to remain a good, highly localized target. The deemtralization issue was what started

all this, remember,"
"Ham-me. Sounds plausible at first, but—forger it. Not a chance of it. Nobody with Bates' financial interests in the city is going to try to destroy it, and that rules out only Dates but anyone else with the power to high-pressure into print a salam against you. Besides paint anough the populate, but on the other hand it puts the superer on the Search Commission. making sure they'll act as quickly and as efficiently as they can. No, for

an get it."

"Still, for whatever reason, Bates
is probably back of His Nibs' pol-

icy."
"It'd he a good guess, all right."
"And why." Rob said half to

himself, "does he go to such lengths to slap down anybody who speaks out for decentralization?"

They sped north along the Drive. Ahead of them was the Highway Search Station, where extrasensitive detectors would scan them, and, in case they revealed radioactivity, would operate relays, causing the car to be photographed and an alarm bell to be rung. Cocone had been caught more than once; the detectors were so sensitive that small amounts of natural uranium adhering to his clothes and shores

past without the Search Commission's police giving chase.

They were now in the Bronx Sector. "Where to?" asked Crate.
"Just a minute. If you'll get off the Drive and stop at the next drugstore, I'll give Charlie another ring."

after lab work could cometimes

actuate them. This time they got

"Use my radiophone if you want."
"We avoid 'em. Easier to inter-

cept them than it is to tap ordinary phone wires."
"O.K." Macomb acceded to

Rob's request.

Another coded phone conversation and Ciccope returned to the
car, to give a few brief directions.

"We're going to look over Import
Station Three," he explained.

"There are two ways we might track
this thing down. The first to localize the source of the active
gases by testing more air samples
at a lower altitude. They're going
ahead with that, and there's not
altitude. They're going
ahead with that, and there's not

s much I can do to belp. The secs ond, assuming that bomb materials are still being shipped in, is to check the import stations through which

all trucking passes."
"You sound pretty certain that

"You sound pretty certain that it is a bomb."
"Without having any idea who

now, I'd say the probability was about twenty-five percent and growing all the time."

Linconsciously, Macomb gave the

Unconsciously, Macomb gave the car another ten miles an hour's worth of gas.

Traffic was light, and they made good time to the import station. As they entered the vast, ware-houselike building, Rob said: "I thought this'd be the station to inspect because those aerola tests seem to localize the thing between ten and fifty blocks northwest of here. Normally I wouldn't suspect this station of having a feek; they have the best equipment of any. They smoke of any carried the station of having a feek; they have the best equipment of any. They smoke of any carbring that the same station of having a feek; they have the best equipment of any. They

through."
"Cadmium? Why?"

"It's one way you might shield U-235 from the radiation detectors. Alloy it with plenty of cadmium and no neutrons get out. Just one of the dodges we have to be prepared for."

Inside the building, three lines of trucks were being sent slowly through what resembled roughly an assembly line. First the walls of the truck would be tested to insure that they were not radiation-absorbent, then a few of the crates, chosen at random, would be broken open

and inspected in the same way. Following this, the truck would be driven slowly down a long double line of confusingly different instruments, and would wait until it had been given the green light by the operators of all the instruments before it proceeded into the Sector. By this time the next truck would have finished its preliminary inspection and would be ready to roll

through The most important of the detectors were modifications of the familiar Geiger-Mueller counter. An alpha particle, proton, or other emission would ionize the gas between two charged plates, allowing discharge. The discharges would be stored on a condenser, which in turn discharged through a glow tube if the counter operated more than a certain number of times in a given interval.

corner of the floor watching the procedure. Ciccone said: "It's not as effective as you might think. The stuff might be brought through here by packing it in the middle boxes of a big truckload, where the outside boxes would shield it. Those guys don't dig down and get at the inside often enough," "I should think this'd be one job

where they'd be more than willing to do a little extra work just to make cure " "No. people aren't that way. It's

a lot of work to half-unload one of those trucks. This is just a job to most of the men, no matter how hard we try to make it something

more; it's just their job, and they make it as easy for themselves as they can.

"Today they're being pretty thorough, though; when I called Charlie I told him to needle the boys up a bit."

"So I see." A large Diesel crane was being used in one of the assembly lines to remove the contents of one truck for individual testing. Several men were clustered around with hand-test sets. In a few minutes Rob went over, motioning

Crate to accompany him. "One thing," he whispered on the way, "whatever you see, don't act more than normally suspicious. You can't forget the possibility that the truck driver, or even one of our men, might be an agent. Hello, Sam. What you got here?"

"Radium dial watches. Darm things scare the pants off us every time. Compared to the little tiny Ciccone and Macomb stood at one bloops we get on our meters from most of this stuff, they look like Himshima "

> "Been getting many?" "Yeah, a good few."

"I hope you check the inside boxes pretty often to make sure the watches' emissions aren't masking something else underneath."

"Yeah, we've been doing that."

"Well." Rob looked down at the one crate out of the truckload which contained the watches. It had been opened, and several of the carefully packed boxes removed An idea struck him and he mentally noted the address on the crate, while apparently examining the watches. The watches were a standard American make

"Well, keep up the good work, Sam," he said casually. "Oh, Sam. Have you seen the Dispatch this morning?"

"No, why?"

"Never mind." After watching a few more trucks pass uneventfully by, he left, accompanied by Macomb.

"Anson Mercantile Company," he said pensively as they climbed back into the car: "no street or number given. As I remember, it's about

ten blocks west and four north. Suppose you let me drive. I think I can find it. If I have to, I'll ask a con. but I didn't want to ask in

there." He did not have to ask a cop.

At Anson's, the two of them looked enough like retailers to get into a salesman's office without delay. Rob interrupted the salesman's commercial cordiality by showing an F.B.I. badge, then asked without explanation, "Who's buying up that shipment of watches that's just coming

"Why-let's see. I don't believe they're all ordered yet." He showed no inclination to continue.

"Who buys watches from you?"
Rob prompted.
"Well--" The man listed several jewelry and department stores.

eral jewelry and department stores.
"Those are the principal ones."
This was not going to be quite as simple as Rob had hoped, "Have

any of them specified any individual shipments, rather than just naming brands?"

"I wouldn't know. I don't have anything to do with---"

"I think you know."
"What is this about, anyway?"
Rob debated whether to fib or

to bully the man with his F.B.I. adge; he decided on the former course. "There's been some high-jacking of watches, and we're trying to track it down." It didn't sound at all plausible, but the man, though baffled, was apparently satisfied.
"Well, now that you mention it."

"Well, now that you mention it," he admitted, "Grelner's has specified shipments several times." He stopped, tentatively.

"That's all," said Ciccone, and he and Macomb left, trying to look like G-men.

"Well," commented Rob, "I guess we can assume for now that he was telling the truth."
"Might I are you comething

"Might I ask you something, sir?"
"Ask me what?"
"The same thing that fellow in

there asked you: what the heck is this all about?" Rob laughed. "I'm sorry. Those watches looked pretty innoceut, didn't they, to be causing all this? But we have to follow up the implausible leads, because all the plausible ones get investigated at the import station. This one is 'highly nontrivial,' as my math prof

used to say." "Look. We let radium dial watches through the import station because no one could possibly extract the fissionable substances from the phosphorescent paint on those things without revealing themselves -even if they could get enough into the city that way. But there's another possibility. What if, instead of natural uranium, you were to use Pu-239, ordinary plutonium, in your phosphorescent paint? It's an alpha-emitter with long half-life, like common U-238; our instruments couldn't tell the difference, You'd have the job of purifying after you got the stuff in, and you'd have to get in an awful lot. It's

just possible, just barely. And all the probable things, as I say, are checked."
"But it'd take so long to accumulate enough plutonium for a bomb.

They couldn't be anywhere finished now, could they?"
"Sure could. They could have

born accumulating the stuff for years without giving themselves away. It wouldn't be until they started purifying that Sneesy—the aerial radioactivity detector—would show anything. That's happened. We'd better follow up on Grehner's, and if it's not that, we'll start looking around again. Grehner's did, after all, ask for particular ship-

ments-those shipments, maybe, that they knew were loaded with plutonium. They wouldn't buy up the whole shipment, because that would seem peculiar to the wholesalers, and the Pu-239 watches are, I suppose, perfectly usable as such, They wouldn't ship the watches in direct to the store, because it's not usual business practice

"Everything fits. Which in itself proves nothing. Still, we can't afford not to check it. I don't think I can get much farther with this investigating, I'd better order a search right now." They had been walking toward the store; now Rob started once more for a phone. "You call police, give my name and the code word 'antipasto', and say 'Greiner's Department Store.' I'll be calling the import station for some detectors."

Luckily Schmidt's Drugstore had two empty phone booths. Nobody looked up as they walked in and slipped into the booths.

Ciccone, as he dialed his number, had a sudden vision. A pillar of multicolored smoke rising from the city, erasing the Bronx and Manhattan down to Central Park. shattering windows in Nyack, lighting up the Albany sky. A nightmare, a familiar and a very real nightmare, an accepted part of modern life, something you couldn't get away from; and it seemed more immediate than ever right now, Trying to pretend it was just fancy, he looked out of the booth at the girl

the middle-aged woman buying

toothbrushes, the suspendered loafer thumbing through the magazines, He thought the commonplaceness of Schmidt's Drugstore might be reassuring; but it didn't help,

"Import Station Three." "This is Ciccone. Could I speak

Again he waited. The nightmare was still there, and somewhere, quite likely just a few blocks from where he was now, were the few ounces of metal that might be the nightmare.

"Hello, Hello, Sam. Send down -anticasto-send down all your mobiles, except for one full battery to be left at the station. Grelner's Department Store. Know where it "Sure do. Right down." Sam

hung up before Rob had a chance to tell him to hurry. He knew that an order like that, in a situation like that, just plain meant "hurry," in capital letters

Hurry. It might already be too late, or they might have months to stare, or there might be no danger at all. Yet the chance was always there that one minute's delay might make all the difference

Always that chance, he thought as he and Macomb walked up the innocent-looking street toward where the police and the search men would soon arrive. The chance that the time he had wasted at the meeting last night, and the hour he had wasted this morning because of that peculiar newspaper episode, might themselves have been fatal. wiping off the drugstore counter, "And yet," he said aloud, "as-

suming we get to this bomb in time ASTOUNDING SCIENCE, PICTION —always assuming that—this man Ellsworth Bates, and whoever else he represents, may be more important than any one bomb. No number of successes can compensate for one failure—"

Crate interrupted him. "The police have started arriving!"

Ciccone knew the routine of the search; he'd been largely responsible for preparing police and search men alike for this eventuality. He knew perfectly well what had to be done, and he also knew that, since the organization was trained to function without him, there was little he could do besides helping with the details.

First a cordon had to be thrown around the block in as short a time as possible after giving the alarm. Plutonium, rough of it to make a bomb, could be taken from the block in a two-passenger coupé, or in the pockets of a few men willing a subject themselve to radioactive poisoning by carrying it inadequately altibled. So the police had to the policy of the policy of the everybody inside the cordon stayed inside.

mission. The search men arrived not long after the police; a feet of bizarretooling, specially-built runcks, roaring through the city with aircus screening, through the city with aircus to the policy of the polic

searchers. Some of these were distributed quickly to the policemen comprising the cordon, and the first part of the search becam.

A bluecoat would beckon to one of the heavillered passersby who lad been caught in the cordon, and then, while a second policeman covered hina, would search the man. This consisted in passing two test sets, one held in either hand, over all parts of his body; reading them and pressing a button to recharge the electrocopes and readjust the counters' potential; and frisking him in the standard manner. He would hen he allowed—cudered, which has been also the said of the counters of the counters' potential; and frisking him in the standard manner. He would hen he allowed—cudered, which has been also the counters of the

Macomb left Rob's side, pad and pencil in hand, to go to where a short, well-dressed man of about sixty was being searched by two bored policemen. Rob dismissed Macomb with the mental comment, "Good story for him."

Himself, he wanted to help with

cleared.

the big job: going through the buildings on the block, one by one, story by story, with every type of instrument from Geiger counter to uranium neutron-detector. It was a big job, it would take a lot of men a long time, and he knew they could use his belp.

The detectors were already being unloaded from the trucks. Sam was organizing a group of about twenty search men to begin on the row of five- and six-story apartments that made up one side of the block: "Say, Sam," hegan Rob.
"Oh, there you are," said Sam.

"Un, there you are," said Sam.
"I didn't see you; I was beginning to think that call was a fake.
Have a counter."

"Say, Sam. why don't you start

at the store itself?"

it wasn't.

"The Sneezles are registering like hell right here—like all hell." He gave a few more instructions and the mea scattered into the build-

Ciccone found it almost a relief to know that the source of the radioactivity had been located failty closely. Now, all the uncertainties involved in his reasoning were resolved. It might have been that Greiner's, like the wholesaler's, was just an intermediate stage in the smuggling; it might have been that the whole lead was a failse one. But

With Sam and one other, he started down the basement steps of the first apartment house, to begin the search at the bottom. One of the tenants was coming down from the second story and looked with amazed curiosity at their test sets and drawn guns. Sam waved him out onto the street, and the three

out onto the street, and the three of them continued on down. But the tedious and dangerous hunt which they had anticipated was interrupted. Suddenly, a becoming voice filled the air. Rob

looked around for a loudspeaker, but, seeing none, concentrated on the words. "You are looking," the voice

"You are looking," the voice said, with a slight foreign intonation, "for the bomb which is being assembled here. I would warm that we have a quantity of plutonium in excess of the critical mass. If any more men enter this block of buildings, or if anyone enters this particular huilding, then the bomb, which is in readiness, will be ex-

ploded."
Rob, followed by the others, ran ont into the street. He didn't know why, but he felt an almost claustrophobic oppression on the apartment stairway. As if getting out of the building would do any good

were an A-bomb to go off!

The voice from the hidden loudspeakers continued, to a petrified
audience of policemen and search
men: "We will leave our laboratory,
which is that building formerly used
as a warehouse by the Greiner's
Store, by helicopter. You must
not attempt to intercete us—"

Rob was standing beside the police captain, looking up at the expressionless row of apartment houses. The decision, he realized, was up to him. Was this a bluff, and dare they call it?

"-will, in any case, be detonated by radio in two weeks. This will give you time to largely clear the area, and the bomb will still accomplish our purpose of disruption. You must not interfere, and you must prepare for the explosion in exactly two weeks' time." A pause, then, "You are looking for the bomb which is being assembled here. I would warne."

It was a record, and it was repeating. The whole message was in Ciccone's hands now; it was up to him. He looked nervously around him. The police cantain. Macomb. and the short, well-dressed old man to whom Macomb had gone earlier. Ciccone hardly saw them.

"-enters this particular building, then the bomb, which is in readiness, will be exploded. We will have our laborators..."

will leave our laboratory—"
"It's a bluff," said Ciccone, and
his voice sounded weak as death.

"Enter the building."

The captain didn't move, but stared straight ahead, his jaw

knotted.
"It's a bluff. If they were going to set off an A-bomb, they wohidn't give us the opportunity to clear the people out of the city, even those few people we could get out in two weeks. They'd try for maximum destruction.

"Either they're not ready, or they are and we've nothing left to lose. Enter the building."

"They're not ready," said a voice behind Rob. He turned; it was Macomb's companion. "Any group which would seed agents to destroy New York, would plan that the agents also be destroyed. Thus any chance would be eliminated of this region, and they make the group, and they might be spread or retailation. Only if the bomb could not be detonated would such a bluff as this be attempted, on the chance that a copter might escape."

Rob stared at the unknown in dumb amazement. The confidence and precision with which he had spoken were—inhuman. But for the moment he ignored

But for the moment he ignored this remarkable interruption and turned once more to the captain. The latter's face had a look almost of resignation as he finally gave the necessary orders to about twenty of the policemen who lined the sidewalk. They hesitated; they, too, could hear that voice over the loudspeaker. "—will still accomplish our purpose of disruption. You must not interfere, and you must prepare for the exolution—"

must prepare for the explosion—"

Somehow, when the first of the
policemen moved to obey, the others
followed. Slowly they advanced toward a gap between two buildings,
through which they could reach the

spot the voice had named as the laboratory site.

"—that we have a quantity of plutonium in excess of the critical mass. If any more men enter this

y block of buildings—"

They advanced, and one by one disappeared through the gap. Ciccone waited. Maybe the men insert side, whoever they were, had not

cone waited. Maybe the men inside, whoever they were, had not observed the violation of their conditions. Yet. Except for the loudspeaker, the whole street was in intolerable silence, as everyone—waited. Finally.

as one, they relaxed and breathed more easily. It was not that they were absolutely certain yet that no bomb would go off, but simply that the tension could not be borne any longer.

The police captain turned to his

car radio.

"In case those boys do get their
belicopter off that roof," he said,
"I'm going to call for some of our
planes to intercept them."

Rob made a mental note to have

planes added to the search plan in the future, and nodded assent. "No." Macomb's companion in-

teriected. "It was a bluff, but you must allow them to escape."

Rob's previous amazement was redoubled. He could find no answer except to blurt, "Who are you,

anyway?" "Ellsworth Bates."

Before Ciccone could reply, all eyes were turned upward by a shout from one of the search men standing nearby. A helicopter was hovering above the apartment buildings, drifting slightly in the wind, and rising.

The captain turned again to his radio, but was halted by the urgency in Bates' voice as he repeated: "No, they must escape. If they are captured, it will be discovered whom they represent, and this country will certainly open fire in retaliation. Every trace of their identity must be lost if there's going to be any chance of peace. Don't you see? It doesn't matter that they are the aggressors, that we, in a sense, would be in the right were we to fight them-whoever they are. The only thing we must consider is the impossibility of our fighting any war with anyhody, now, Unfortunately, it's a thing our government, and our people, will probably not consider it these men are identified.

"The whole thing can be reported to the Security Council. They can investigate-secretly. The

United States must not investigate." He paused. "Sabotare bomb attack is the only method of atomic warfare that can be used as long as the Security Council controls the world's atomic power. Fissionable clements are rigidly controlled, they're hard to get, no one can get enough of them away from the Security Council's jurisdiction to arm a floet of rockets. And a fleet is what you'd need to stand a chance of setting through a modern radarrocket defense screen. Sabotage bomb attack is the only thing left.

"Until open warfare breaks out. Then, one or both of the warring nations defy the Security Council, grab all the fissionable elements they can, and what have you? Chaos-Ruin. If you like to put it that way, the end of civilization. Once the Security Council's power is broken and the rocket-atomic war starts, we're lost, that's all,

"Mr. Ciccone, I realize vou're in charge here, and I'm unable to force your decision. Nevertheless, you've got to let that copter get awaydelay your pursuit, say, ten minutes, and don't make it seem deliberate. More than that, you've got to destroy the evidence in that building-again accidentally-and. if possible, destroy so much that it can't be proved a bomb was ever in the process of construction,"

He stopped. Rob looked up to where the helicopter was dwindling into the distance. "Mr. Bates, if there has been one bomb, there can be another, maybe from the same sonnie."

"No number of successes can make up for one failure. Precisely. But we wouldn't avert that possible failure by tracing down this bomb attempt. We'd precipitate it.

bomb attempt. We'd precipitate it.
"Granted, we'd find the culprit's
identity. But after the cities of
this and every other country had
been destroyed, it'd be small consolution to know who started the
thins."

Then something happened inside Rob, and the nightmare was on him again. The light too bright to be seen, the sound too loud to be heard, the horror too great for any man to know. He sighed, and snoke to the cautain:

"You heard what he said?"

"Yes."
"Do what he said about the heliconter. The rest of it, forget. I

mean that-forcet it." Ciccone sat with Macomb and Bates in the front room of Crate's Greenwich Village flat, recounting the steps he had taken to follow Bates' plan. "It may work out," he said. "No one's been all the way inside the lab vet, except Sam and me. The lab will be accidentally destroyed tonight, after the plutonium has been removed and Sam has seen plenty of things which were not there at all. And Mr. Bates. if your spell over the newspapers is as great as Macomb says it is, they may all print our version of the story." He indicated a Diseatch extra in his hand, "The radioactives were brought in by private experimenters dodging the U.N.O., they tried the bomb bluff in order to escape, and they then eluded police pursuers. No matter

how much perjuring we do it's a weak story,"

"No," replied Bates, "with a few loopholes patched up, it"ll go. It we're long on theorizing and minimize the actual faking; we'll get our result without much risk. And don't worry about the perjury; this

is one end that justifies any means."
There was a silence while Ciccone gathered his courage. Bates
was no longer the evil gentlus ha
had seemed earlier in the day;
nevertheless courage was required
to begin, "So now we have one
success—we've postponed the fatal
failure a little further."

Bates smiled. "Unless I miss my guess, you're getting back to decentralization."

Macomb took up the theme.

"Yes," he said, "that problem's still there. This bomb's been found, this crisis may soon be over; but there'll be others. We'll never have even relative safety until everything is so uniformly distributed that no one bomb can destroy more than one of the old block-busters could now."

"I'll try to explain the thing to you," Bates began slowly. "You're right, that would be the only way to safety. You're also right in thinking that I've been suppressing the movement toward decentralisation Now wait a minute; please don't interrupt. I know I seem to be contradicting myself, but let me

start from the beginning. "Ten years ago several of the smaller European nations, which had not been getting much information on nuclear physics from the larger nations, independently developed working chain-reactions. Tension mounted, and a large-scale atomic war might have resulted had not the world been too exhausted from the recent World War II. As it was, everybody not such a bad case of the litters that the affair was halted before the A-bomb was hear

"This world-wide case of the jitters had other effects, you remember. The Security Council was quickly given supervision over all piles, plus sizable military and intelligence forces. Second, the movement for decentralization was started."

"And stopped," put in Ciccone. "Yes. To what, if I may ask, did you ascribe its failure?"

"Lack of vision on the part of -well, leaders of industry. People like you could have swune it." "No. The people whom you call leaders of industry saw everything you saw in the situation, and they did try to swing it. The thing is, when they got right down to cases

be specific, they saw that decentralization was impossible." "Impossible?"

> "Because of a factor which the scientist finds it easy to ignore; the terrific mertia of our civilization. Here's the way it works. New Vork businessmen see that the world would be a much safer place if all business were to disperse away from the big metropolitan centers. They think it would be fine if this were to be done. But they can't do it themselves if, say, Prague businessmen are going to remain concentrated, because it'd be a big financial blow to New York to stand the expense of moving and to give up their ready access to transportation. They wouldn't be able to compete with Prague, or London, or Calcutta, as the case might be-whatever city didn't go along. Unless everybody will take the step, nobody will take it. It has to be world-wide, and ten years

ago the world wasn't unified enough. "You remember the 1929 crash? A little before your time, I guess, It was the same thing. The economists saw it coming several years ahead, but no one could duck out of the wave of overinvestment, because if they did, their competitors would not, and would continue to make profits from the boom. Everyone had to keep riding the wave as long as possible even though they knew such a policy was just insuring that the crash, when it came, would be really serious, they saw something you missed: to There you are: inertia. Our overgrown civilization starts going in one direction, and it's just too much for individuals to stop.

"So decentralization was impossible ten years ago. With different conditions and with a stronger political movement, it might have gone; but it didn't. We took what seemed like the next best plan, radar screens plus search programs, and so far it's worked.

"Today, gradual decentralization has progressed to some extent, thanks to improved transportation and individuals' mistrust of cities. A new movement for the abrupe sort of decentralization would have some chance—leas inertia now to overcome; but if it succeeded it

would be very dangerous. "In the last ten years, many things have changed. Reconstruction of the destruction of World War II is to all intents and purposes finished; capital is freed and looking for new investment opportunifies: manufactured goods are looking around for markets. It's the type of situation where motives for aggression may be present, and everyone's littery again. The litters are not nearly so widespread as they were before, or even as they were after Hiroshima and Nagasaki, but they're having a much worse effect, and they're building up. Certain groups in several different countries are beginning to think seriously of atomic warfare, of beating the other guy to the punch and grabbing whatever's left when the smoke clears. Many of those who aren't considering it, are

n suspecting others. And everyh body has to keep his defenses up. "Now. What are our defenses?

"Now. What are our defenses?"
Let me list them again: radar screens, searches, and Security
Council supervision of fissionable elements. Well, you tell me, Mr.
Giccone—what would happen to the effectiveness of your search program if New York were to be-

gin toniorrow to move en masse to the Mohawk Valley?"
"Yes, I see what you mean. We'd have a hard time keeping up even a pretense."

"You certainly would. New York could be blasted before it had got well started moving. Another thing; atomic power plants, too, are centralized, to simplify the Security Council's job of control so no doubt you'd ask that they be included in the program of dispersal. But think of the confusion involved in moving hillions of dollars' worth of industrial plant. How could a merely human Security Council prevent the smuggling out, somewhere, of a few hundred pounds of U-235 or Pu-2307

"No, the pressure's on, and we have to stick by the choice we made.
"Our civilization: a great, big, overgrown truck going much too fast. Suddenly the road became dangerously narrow, and elippery besides, but the truck was too big and it was going too fast. It couldn't stop. Now we have only of our whorls, but we still cent do what you suggest, stop, get out, and look for a detour. No, we detour, no.

chosen our road and we've got to stick to it.

"Not much seems to be changed, at first glance—the truck's engine still runs smoothly—the steering gear still responds—even the driver isn't in such bad shape. Yet come tomorrow, it may all be over. If we don't steer straight, it certainly

will be, "Makes quite a picture. Our

magnificent, overgrown, bungling civilization going on its own magnificent and senseless way because it is so big that nothing can stop it, so bir that it can't even stop it-

Bates stopped speaking but neither Ciccone nor Macomb answered. There was no answer

Ten years ago, there might perhaps have been, but not now,

Now if we could just control the wrather, and have just the kind of climate we want—humanum—but when "we j'm and with of "win" want? And if the farmers in central Florida want rain for their crops, and the report owners along the down and nothing but usualidas—low are the weather-controller to move the rain-producing storms-area into central Florida without clonding up the succost, even if they wonthey succeed in keeping if from derizing all over the would-be sumbatteral?

"Forecast"—as a forecast for weather control—suggests to Ray Jones that the political and economic conditions are going to under for Grade A \$1 storms!

The simplest way to drive a same man mad is to face him with an absolutely insoluble dilemma. There are more complex ways, of course—but the cure gets complicated, too, and sometimes fails—

Illustrated by Orban

When Dawson got back from his vacation in Florida, he was feeling no better. He hadn't expected a miraculous cure. In fact, he hadn't expected anything. Now he sat morosely at his desk, staring out at the tower of the Empire State and vaguely hoping it would topple.

Carruthers, his portner in the law firm, came in and bummed a cigarette. "You look lousy, Fred," he remarked. "Why not go out and have a drink?" Daw-"I don't want a drink." Daw-

"I don't want a drink," Dawson said. "Besides, it's too early. I had enough liquor in Florida." "Maybe too much."

"No. What priped me was . . . I dunno." "Great psychoses from little

acorns grow." Carruthers said, his plump, pale face almost too casnal

"So now I'm nuts?" "You could be. You could be. Give yourself time. Why this abnormal fear of psychiatrists, anyway? I got psychoanalyzed

once ! "What happened?"

"I'm going to marry a tall, dark woman," Carruthers said. "Just the same, psychiatry isn't in the same class with astrology. Maybe you bit your grandmother when you were a child. Drag it out in the open. As long as you keep thinking, 'What big teeth you have,' you'll dwell in a morass of mental misery."

"I'm not in a morass," Dawson said. "It's just-" "Yezh, Yust- Listen, didn't you go to college with a guy named

Hendricks " "I did "

"I met him in the elevator last week. He's moved here from Chicago. Got offices upstairs, on the twenty-fifth floor. He's supposed to be one of the best psychiatrists in this country. Why not go see

him?" "What could I say?" Dawson asked. "I'm not followed by little

green men." "Lucky man," Carruthers said.

"I am, Day and night. They drink my liquor, too. Just tell Hendricks you smell dead flies. "There's a lot I want to ask you You probably pulled the wings off

an anopheles when you were a tot. It's as simple as that, see?" He rose from his chair, put his hand on Dawson's shoulder and added quietly, "Do it, Fred. As a favor to me."

"Um. Well- O. K." "Good." Carruthers said, brightening. He looked at his wristwatch. "You're due at his office in five minutes. I made the

appointment vesterday." He fled. ignoring the curse Dawson flung at his head. "Room twenty-fiveforty," he called, and slavamed the door. Scowling, Dawson located his

hat, left word with the receptionist as to his whereabouts, and rode the elevator up. He met a short, fat, cherubic man in tweeds emerging from twenty-five-forty. Mild blue eyes considered him through glistening contact lenses. . "Hello, Fred," the man said.

"Don't know me now, eh?" "Raoul?" Dawson's voice was doubtful.

"Right, Raoul Hendricks, somewhat fatter after twenty-five years. I'm afraid. You look the same. though. Look I was just going down to your office. I didn't have a chance to eat breakfast this morning. What about a bite downstairs?"

"Didn't Carruthers tell you-" "We can kick that around better over food," Hendricks steered Dawson back to the elevator-

about. The college chaps. I didn't ASTOUNDING SCIENCE, PICTION keep in touch. I was in Europe most of the time." "I kept in touch." Dawson said.

"Remember Willard? He's just been indicted in an oil mix-up-" They talked over onion soup

and through the entrée. Hendricks listened, mostly. Sometimes he watched Dawson, though not pointedly. They were in an iso-

lated booth, and, after coffee had been served. Hendricks lighted a cigarette and blew a smoke ring. "You want a snap diagnosis?"

he asked. "O. K."

"You're worried about something? Do you know what it is?" "Certainly I know," Dawson said. "It's a sort of daydream,

But Carruthers told you that." "He said you smelled dead

flies." Dawson laughed. "On a windowpane. A dusty windownene. Probably it isn't that at all. I just got the impression, no more than that. I never see anything,

consciousness " "It never occurs in your sleeping dreams?"

"If it does, I don't remember, It's always a flash. The worst part is that I know at the time that it's the windownane that's real. Usually it happens when I'm doing some routine stuff. Suddenly I get this flash. It's instantaneous, I feel, very certainly, that whatever I happen to be doing at the time is a dream. And that really

I'm somewhere smelling dead flies on a dusty windowpane."

"Like the Red King? You think somebody's dreaming you?" "No. I'm dreaming - this,"

Dawson looked around the restau-

"Well," Hendricks said, "possibly you are." He stubbed out his cigarette, "We get into metaphysics at that point, and I'm lost, It doesn't matter which is the dream. The main thing is to believe in the dream while you're having it. Unless it's a night-

mare." "It isn't," Dawson said. "I've had a pretty good life so far." "Then where are we? You

don't know what's worrying you. The dream's merely a symbol. Once you realize what the symbol represents, the whole structure collapses, and any neuroses you may have are gone. As a general

rule, anyway." "Ghosts can't stand light, is that it?" "That's it, exactly. Don't mis-

understand me. Neuroses can It's a sort of extension of sensory build up eventually to true psychoses. You've got something like an olfactory hallucination. But there's no accompanying delusion. You know the windowpane isn't there."

"Yeah," Dawson said, "but there's something under hand." "Tactile hallucination?

does it feel like?" "Cold and hard. I don't know what it is. If I move it, something will happen."

"Do you move it?" After a long moment Dawson said "No," very softly.

"Then move it." Hendricks adpaper and adjusted his watch, "Let's have a jury-rigged wordassociation test. O. K.?"

"Well-wby?" "To find out the causation of

your windownane. If there's a mental block, if the censor's working, it'll show up. Spring cleaning. If you clean a house regularly, you save a lot of work later. No chance for cobwebs to accumus late. Whereas if you let the stuff pile up, you're ant to get a real psychosis, with all the trimmings, As I just said, it's a question of finding the cause. Once you lo-

cate that, you know it's a straw dummy, and it doesn't bother you any more?" "What if it isn't a straw dummy ?"

"Then, at least, you've recognized it, and can take steps to get rid of the incubus." "I see," Dawson said slowly, "If I'd been responsible for a man's death years ago, I could buy

peace of mind by taking care of his orphaned children." "Read Dickens." Hendricks said. "Scroore is a beautiful case history, Hallucinations, persecution complex, guilt complex-and atonement." He glanced at his watch

"Ready?" "Ready" When they had finished Hendricks blinked at the results. "Normal," he said. "Too normal. A few odd quirks-but it takes more than one test to get any

be empirical-though it's somevised. He took out pencil and times necessary. Next time you have that daydream, move the gadget under your hand." "I don't know if I cau," Dawson

said.

But Hendricks only laughed. "Neural paralysis of the astral." he suggested. "I'm relieved, Fred. I'd rather gathered you were slightly off your rocker. But the layman always overestimates mental ouirks. Your friend Carruthers has probably got you a bit wor-

"Maybe,"

strongly.

"So you've got a hallucinatory daydream. That isn't uncommon. Once we find the cause, you'll have nothing left to worry about. Come in tomorrow, any time-give me a call first-and we'll give you a physical checkup. More coffee?"

"No," Dawson said, and presently left Hendricks at the elevator. He was feeling irrationally relieved. Though he discounted a good deal of the psychiatrist's professional optimism, he felt that the man's argument held water. There was logic in it. And certainly it was illogical to let a daydream influence his moods so

Back in his office, Dawson stood at the window, staring out over the serrated skyline. The low, hushed roor of traffic mounted from the canyons below. In forty-two years he had come a long way, partner in a law firm member of a dozen clubs, taking an active interest in definite result. We don't want to a variety of matters-a long way. for a boy who had begun his career in an orphan asylum. He had married once, but there had been a divorce, amicable on both sides. Now it was more convenient to maintain a backelor apartment near Central Park. He had money, prestige, power—none of which would help him if the hallucination developed.

On impulse he left the office and visited a medical library. What he found only confirmed Hendricks' remarks. Apparently, as long as he didn't believe in the real existence of the dusty windowpane, he was fairly safe. When he did, dissociation stepped in, and all but subjective, false logic would fall. Men have a vital need to believe they are acting rationallyand since so many basic motives are too hidden and complicated to unscramble, they assign arbitrary meanings to their actions. But why a dusty windownane-

"Yeah," Dawson thought, thumbing through pages. "If I believed in this dream, I'd... uh... erect secondary delusions. I'd think of a good reason why there was a windowpane. Only there isn't any resson, buckliv."

reason, incesty."

As he walked out of the library, and saw the stream of street traffic before him, he suddenly felt that he was dreaming. And the windownene was back again.

pane was tack again.

He knew he was lying close against it, his nose almost touching the glass, inhaling dust with every breath, and the smothering, dreary, semehow brownish odor of dead flies. It was singularly horrid—

that feeling of suffocation and dead despair. He could feel the hard something under his hand, and he knew with a sudden sense of urgency that unless he moved it -- now--he was more than likely to smother there with his nose against the glass, smother from sheer inertia, inability to move. He knew he must not slip back into the dream of being Dawson. This was reality. There was nothing tangible about Dawson and his fool's paradise and his dream-city of New York. Yet he could lie here and die with the smell of dead flies in his nostrits, and Dawson would never suspect until that dreadful last moment between waking and death when it was too late to move the . . . the hard

object beneath his hand.

Traffic roared at him. He stood
at the curb, white and sweating.
The unreality of the scene before
him was briefly shocking. He
stood motionless, waiting until the
hollow world had resumed its
tangibility. Then, his lips tight,

he hailed a taxi.

Two stiff shots of whiskey were comforting. He was able to contemplate working on the current brief, a liability case which presented no difficulties. Carruthers had gone to court, and he didn't see his partner that afternon. Nor did the—hallucination

But, after dinner, Dawson telephoned his ex-wife, and spent the evening with her at a roof-garden. He didn't drink much. He was trying to recapture something of the vital reality that had existed during the early part of their marriage. But he wasn't too successful.

The next morning Carruthers came in, perched on Dawson's desk, and cadged a cigarette.

"What's the verdict?" he wanted to know. "Do you hear voices?" "Often," Dawson said.

hearing one now. Yours." "But is Hendricks any good,

really?" Dawson felt unreasonably irritated. "Do you expect him to wave a magic wand? All therapy

takes time." "Therapy, huh? What did he say was wrong?"

"Nothing much," Dawson didn't want to discuss it. He opened a law book pointedly. Carrothers tossed his cigarette into

the wastebasket and shrugged "Sorry. I'd thought-" "Oh. I'm all right. Hendricks is

pretty good, really. My nerves are a bit shot." Comforted, Carruthers said something and went back to his office. Dowson turned a page, read a few words, and felt things close in. The morning sunlight, slanting through the window, faded abruntly. Under his hand was a cold, hard object, and strong in his

nostrils was the dusty smell of despair. And this time he knew it It did not last long. When it

was reality. had gone, he sat quietly, staring at the bollow desk and the bollow wall beyond it. The sounds from

20

the traffic below were dream-noises. The curl of smoke spiraling up from the wastebasket was dreamsmoke. "I hope you don't think you're real." Tweedledum said scorn-

He noticed that the smoke had changed to orange flame. The cur-

tain caught fire. Presently be would waken. Someone screamed, Miss Anstruther, his secretary, stood in the

doorway, pointing. After that, there was confusion, shouting, and the spurting of a fire extineuisber.

The flames died. The smoke vanished

"Oh, dear," Miss Anstruther said, wining a smudge from her nose. "It's lucky I came in when I did. Mr. Dawson. You had your

nose in that book-" "Yeah," Dawson said, "I didn't even notice. I'd better speak to Mr. Carruthers about throwing

cigarettes in the wastebaskets." Instead, he telephoned Hendricks. The psychiatrist could see him in an hour. Dawson passed the time with a crossword nuzzle, and, at ten, went upstairs and stripped.

Hendricks used stethoscope, bloodpressure gadget, and other useful devices "Well?" "You're all right." "Sound as a nut ch?"

"A nut?" Hendricks said. "Come on. Let's have it. happened?"

Dawson told him. "It's like epilepsy. I don't know when I'll

have these attacks. They've never lasted long so far, but they might. And afterwards—the dream-feeling hangs over. I knew very well that there was a fire in the wastebasket, but it wasn't a real fire."

"Daydreams are apt to carry over a bit. Reorientation isn't always instantaneous."

Dawson chewed on a fingernail.
"Sure, but—suppose Carruthers
was falling out of a window? I
wouldn't have tried to stop him.
Hell, I'd have walked off a roof
myself. I'd have known it
wouldn't have hurt me. It's a
dream."

rer "Do you feel you're dreaming ht. now?" nr "No." Dawson said, "not now.

ng "No," Dawson said, "not now, at of course! It's only during these ct, attacks, and afterward—"

"You felt that hard object under your hand?"
"Yeah. And the smell. There was something else, too—"

"What?"
"I don't know."

"I don't know."
"Move that object. It's a

compulsion, in four-bit words. And don't worry about it."
"Not even if I walk off a roof?"
"Stay away from roofs for a

"Stay away from

while," Hendricks said. "Once you find out the meaning of this symbolism, you'll be cured." "And if I don't, I'll get second-

ary delusions."
"You've been reading up on it,
eh? Look. If you think you're
the richest man in the world, and
you haven't got a dime in your
nocket, how'll you rationalize

that?"

"I don't know," Dawson said.
"Maybe I'm eccentric."
Hendricks shook his head, his plump checks bobbing. "No, you'll

develop the logical delusion-a supplementary one-that you're the victim of an organized plot to rob you. Catch? Don't try to assign phony meanings to your dusts windownane. Don't start thinking a little man named Alice is purping out of the woodwork with a windownane tucked under his arm. Or that the glass-blowers' union wants to persecute you, · Just find the real meaning behind the symbolism. As I told you, Move that gadget under your hand, Don't simply be passive about it." "O. K.," Dawson said. "I'll

move it. If I can."

He dreamed that night, but it was a typical dream. The familiar hallucination didn't emerge. In stead, he found himself atonding on a gibbet, a rope about his neck. Hendricks came rushing up, waving a paper roll tied with a bine rib-hen. "You're repriesed!" the psychiatrist shouted, "Here's your pardon! Signed by the governor." He thrust the roll into Dawson's

hands. "Open it." he ordered ungorily. "Unite he ribboo."
Dawson didn't want to, but Hendericks kept insisting. He pulled at the ribbon. As he did, he saw that it was tied to a long cord that snaked: across the platform at A bolt cilcked. He felt the trapdoor quiver under his feet. By pulled at the ribbon, he had opened the dron: he was rafiling.

He woke up, sweating. The room was dark and silent. Cursing under his breath, Dawson got up and took a cool shower. He had not lad nightmares for years.

There were, after that, two more interviews with Hendricks. Each

time the psychiatrist probed more deeply. But the refrain never altered. Recognise the symbol. Many your hand. Renember, On the third day, as Dawson san

waiting in Hendricks' outer officehe remembered.

The familiar, leaden, sick inertia sweet over him. Desperately he

tried to focus on the buildings ourside the window. But he could not hattle the tide. At the last momen Hendricks' advice occurred to him, and, as he felt the coldhard object under his palm, he remade a tremendous effort to move

made a tremendous effort to move his hand.

To the left, something told him.

To the left.

It was hard to battle that belongy, that amothering, dusty sufficiation of despair. And it was hard to move. But he strained to send the innuise down

The last thing before-Before what?

"Vital therapy," a voice said. "We grow fewer yearly. And we

must quard against that blaque." Karestly ran an eight-fingered hand over his sweating, bald head, "The tests show you need it,

Dawsso"

"I badn't--" "You wouldn't know of course, It'd be imperceptible except by the instruments. But you need the therapy, that's certain."

"I can't spare the time." Dawsao said. "The simplification formulas are just beginning to clear up. How long must I stay in the vorkyl?**

doesn't matter." "And Plearr went in last month." "He needed it."

Dawsao stared at the wall, made a mental signal, and opaqueness faded to translucence and transparency. He could see the City.

Karestly said, "You'd never vorkylled before. You're one of the youngest. It isn't bad. It's stimulating, curative, and necessary."

"But I feel normal." "The machines don't lie. The emotion factor is wrong. Listen to me. Dawsao. I'm a great deal older than you, and I've been in the vorkyl twelve times."

Dawson stared "Where to?" "Different eras each time. The

one best fitted for my particular warp. Once it was Brazil in 1890. Another time, Restoration London, And the Second Han Empire, I had plenty to do. I spent ten years in Brazil, building a rubber em-

pire." "Rubber?"

Karestly smiled, "A substance -it was important at that time. I kept busy. It's fine therapy, In those days, the only therapy they knew involved painting, construction-visual and tangible, not the emotional and psychic

therapy we use. However, their minds weren't developed." "I hate the idea of being shut up

in a five-sensed body," Dawsao "You wouldn't know any better.

There's the artificial mnemonic angle. Your life-force will take "Half a year," Karestly said. "It possession of the body that's created for you at the therapic epoch we choose, and you'll have a full

set of phony memories, created especially for that period. You'll probably begin as a child. There may be temporal compression, so you'll be able to live thirty or forty years in a half-year of our time."

"I still don't like it." "Time travel," Karestly said, "is the best therapy known today, You live in a new environment. with a new set of values. And that's the vital part. You get away from the current herd instinct

that's caused all the trouble." "But-" Dawsao said. "hut! Only four thousand of us still sane.

in all the world! And unless we work fast_"

83

"We're not immune. The whole trouble is that for hundreds of generations the race has followed folse volues which conflicted with the primary instincts. Overcomplication plus oversimplification, both in the wrong places. We haven't kept pace with our growing mentality. There was a man -Clemens-who owned a mechania cal typesetter that was perfect except for one thing. It was too complicated. When it worked, it was ideal, but it kept breaking

dones 2 "Old stuff." Dawsao said, "I know the trouble. The machines are so encomparely complicated now that humans can't keep up with theres "

"We're solving it," Karestly said. "Slowly but surely There are four thousand of us. And we know the right therapy now. After you've had six months in the vorkyl, you'll be a new man. You'll find temporal therapy is foolproof

and absolutely certain," "I hope so. I want to get back to my work."

"If you went back to it now, you'd be insane in six months," Karestly pointed out, "Temporal travel is like preventive serum shots. You'll be occupied; we'll send you back to the twentieth conturn-"

"That for back?" "That period's indicated in your ease Vou'll be given a consulete set of artificial memories, and while you're in the past, you'll have

this reality. I mean."

"Well-" Dawson said "Come on." Karestly rose and floated toward the transporter-disk.

"The vorkyl's ready for you. The matrix is set. All you have to do is " Davisao got into the case. It

closed behind him. He took a last look at Karestly's friendly face and tightened his hand on the coutrol. He moved it toward the

right. Then he was Fred Dawson, with a complete set of artificial memories, in the orphan asylum in Illimaia

But now he lay in the vorkyl, his nose against dusty glassocene that smelled of dead flies, and the vitiated air tore at his throat as he tried to breathe All was in gray semidarkness around him. He sent out a frantic thought-

command. Somewhere light grew. The distant wall faded to transparency. He could see the city. It had changed. It was older.

And a heaped pile of dust made a easony aton the vorkyl in which he rested.

The immense, red sun washed the city in bloody gloom. There was no sign of organized activity. Figures moved here and there in the rules. He could not make our what they were doing

He looked for Administration Building, the last stronghold of the race. It had altered too. A lone time must have possed since he had entered the vorkyl. For ruin had no consciousness of reality. Of touched the great tower, and the

white, naked shapes that crawled ap and down the structure showed no sign of intelligence. The last light had gone out, then. The tide of madness had engulfed the four

thousand.

He used his seventh sense of perception, and his guess was contirmed. In all the world, there was

no sanity. The berd instinct had

riumphed.

And he could not breathe. That suffocating horror was a reality now. The last oxygen left in the scaled once was rapidly being ab-

scaled case was rapidly being absorbed by his now-active lungs. He could, of course, open the vorkyl— To what?

Dawsao moved his hand. The

Control swung to the right again.

He was sitting in the psychiatrist's outer office. The receptionist was at her desk, scribbling something; she didn't look at him. The white light of morning sunshing sunshing.

made patterns on the rug.

The reality—
"You may go in now, Mr. Daw-

yled Dawson stood up and walked into wed Hendricks' sanctum. He shook last bands, muttered something, and

sank into a chair.

Hendricks referred to his charts.

"O.K., Fred," he said, "Feel up to another word-association test."

to another word-association test!
You're looking a bit better."

"Am I?" Dawson said. "Maybe I know what the symbol represents

Hendricks looked at him sharply. "Do you?"
"Maybe it isn't a symbol at all.

"Maybe it isn't a symbol at all.

Maybe it's a reality."

Then the familiar sensation came

back, the dinity, sufficienting claustrophobia, and the window span and the brownish, dry smell, and the sense of terrible ungreavy. But there was nothing to be done about it now, nothing at all. He waited in a moment it was gone again, and he locked across the desk at Hendricks, who was saying sometime about the danger of secondary delusions, of rationalking.

"It's a matter of finding the right sort of therapy," insisted the hollow man.

THE END.

"We are approaching a sun which is about to become a Nova Detonor tion will occur in seven hours, with an uncertainty of one hour, leaving us a maximum of only four hours for exploration. There are ten planets in the system about to be destroyed-and there is a civilization on the third. That fact was discovered only a few days ago. It is our tragic mission to contact that doomed race, and if possible to save some of its numbers. I know that there is little we can do in so short a time with this single ship. No other machine can nossibly reach the system before detonation occurs."

There was a long pause during which there could have been no sound or movement in the whole of the nighty ship as it sped silently towards the worlds ahead. Alveron knew what his companions were

thinking and he tried to answer their unspoken question.

"You will wonder how such a disaster, the greatest of which we have any record, has been allowed to occur. On one point I can reassure you. The fault does not lie with the Survey.

"As you know, with our present feet of under twelve thousand ships, it is possible to re-examine each of the eight thousand million solar systems in the Galaxy at intervals of about a million years. Most worlds change very little in so short a time as that.

"Less than four hundred thouand years ago, the survey slip \$5,600 examined the planets of the system we are approaching. It found intelligence on none of them, though the third planet was teening with animal life and two other worlds had once been inhabited. The usual report was submitted and the system is due for its nest examination in six hundred thousand years,

"It now appears that in the incredibly short period since the last survey, intelligent life has appeared in the system. The first intimation of this occurred when unknown radio signals were detected on the planet Kulath in the system X29.35, Y34.76, Z27.93. Bearings were taken on them and they were found

to come from the system ahead.

"Kulath is two bundred lightyears from here, so those radio
waves had been on their way for
two centuries. Thus for at least
that period of time a civilization
has existed on one of these worlds
—a civilization that can generate
cledromagnetic waves and all that

that implies.

"An immediate telescopic examination of the system was made and it was then found that the sun was in the unstable prenova stage. Detonation might occur at any moment, and indeed might have done so while the light wasse, were on.

their way to Kulath.
"There was a slight delay while
the supervelocity scanners on Kulath II were focused on to the systen. They showed that the explosion had not yet occurred but was
only a few hours away. If Kulath
had been a fraction of a light-year
further from this sun, we should
never have known of its civilization until it shed cased to exit

"The Administrator of Kulath contacted Sector Base immediately, and I was ordered to proceed to the system at once. Our object is to cave what members we can of the doomed race, if indeed there are any left. But we have assumed that a civilization possessing radio could have protected itself against any rise of temperature that may have already occurred.

"This ship and the two tenders will each explore a section of the planet. Commander Torkake will take Number One. Commander Orostron Number Two. They will have just under four hours in which to explore this world. At the end of that time, they must be back in the ship. It will be leaving then, with or without them. It will give

the two commanders detailed instructions in the control room immediately.

"That is all. We enter atmo-

sphere in two hours." On the world once known as Earth the fires were dving out: there was nothing left to burn. The great forests that had swept across the planet like a tidal wave with the passing of the cities were now no more than glowing charcoal and the smoke of their funeral pyres still stained the sky. But the last hours were still to come for the surface rocks had not yet begun to flow. The continents were dimly visible through the haze, but their outlines meant nothing to the watchers in the approaching ship. The charts they possessed were out of date by a dozen Ice Ages and more

deluges than one.

The Spood had driven past Jupiter and seen at once that no life could exist in those half-gascous oceans of compressed hydrocarbons, now crupting furiously under the sum's abnormal heat. Mars and the outer plenets they lad missed, and Alveron reclined that the worlds nearer the sum than Earth would be likely, he thought sadly, that the tragedy of this unknown race was aready finished. Deep in his heart, he thought it might be better so. The slip could only have carried a few hundred survivors, and the problem of alection had been haust-

Rugon, Chief of Communications and Deputy Captain, came into the control room. For the last hour he had been striving to detect radiation from Earth, but in vain. "We're too late," be announced

gloomily. "I've monitored the whole spectrum and the ether's dead except for our own stations and some two-bundred-year-old programs from Kulath. Nothing in this system is radiating any more."

He moved towards the giant vision screen with a graceful flowing motion that no mere biped could ever hope to imitate. Alveron said nothing: he had been expecting this

news.

One entire wall of the control room was taken up by the screen, a great blake rectangle that gave an impression of almost infinite depth. Three of Rugon's slender control tentacles, useless for heavy work to the control tentacles, useless for heavy work to the control tentacles, useless for heavy work and the creen lit up with a total and the screen lit up with a total sand points of light. The star field flowed swiftly to gast as Rugon ad-flowed swiftly to gast as Rugon ad-

the justed the controls, bringing the the projector to bear upon the sun itand self.

No man of Earth would have recognized the monstrous shape that filled the screen. The sun's light was white no longer; great violetblue clouds covered half its surface and from them long streamers or flame were erupting into space. At one point an enormous prominence had reared itself out of the photosubere, far out even into the flickering yeils of the corona. It was as though a tree of fire had taken root in the surface of the sun-a tree that stood half a million miles high and whose branches were rivers of flame sweeping through space at bundreds of miles a second.

"I suppose," said Rugon presently, "that you are quite satisfied about the astronomers' calculations. After all—" perfectly safe," said

Alveron confidently. "The spoken to Kulath Observatory and the bave been making some additional checks through our own instruments. That uncertainty of an hour includes a private safety margin which they won't tell me in case I feel tempted to stay any longer." He glanced at the instrument

n, board.
an "The pilot should have brought

rd the screen back to the planet, please.
rk Ah, there they go!"
There was a sudden tremor un-

There was a sudden tremor underfoot and a raucous clanging of slarms, instantly stilled. Across the vision screen two slim projecilles dived towards the looming mass of Earth. For a few miles they traveled together: then they separated, one vanishing abruptly as it entered the shadow of the planet.

Slowly the huge mother ship, with its thousand times greater mass, descended after them into the raging storms that already were tearing down the descript cities of Man.

It was night in the hemsphere over which Christma drove his thy command. Like Torkalee, his mission was to photograph and record, and to report progress to the mother ship. The little count had no room four continuous of the country of the countr

could come later... where the country are the country and the country are the country light, for a great nursual display was raging over half the world. But the image on the vision screen was rince that the country are considered to the country a

atmosphere.

The machine fled on through the storm, and presently the desert of rock began to climb towards the sky. A great mountain range lay ahead, its peaks lost in the smokeladen clouds. Orostron directed

the scanners towards the horizon, and on the vision screen the line of mountains seemed suddenly very close and menacing. He started to climb rapidly. It was difficult to imagine a more unpromising land in which to find civilization and he wondered if it would be wise to change course. He decided against it. Five minutes later, he had his

reward.

Miles below lay a decaptated mountain, the whole of its summit sheared away by some tremendous feat of engineering. Rising out of the rock and straddling the artificial plateau was an intricate structure of metal griders, supporting masses of machinery. Orostron brough his ship to a halt and splaraled down

towards the mountain.

The slight Doppler blur had now vanished, and the picture on the screen was clear-cut. The latest control of the contr

Orostron turned to his colleagues.
"It looks like some kind of observatory to me," he said. "Have
you ever seen anything like it be-

servatory to me," he said. "Have you ever seen anything like it before?"

Klarten, a multitentacled, tripedal creature from a globular clus-

ter at the edge of the Milky Way, had a different theory.

"That's communication equipment. Those reflectors are for focusing electromagnetic beams. I've seen the same kind of installation on a hundred worlds before. It may even be the station that Kuboth nicked un-though that's cather unlikely, for the beams would be

very parrow from mirrors that size." "That would explain why Rugou could detect no radiation before we landed," added Hansur II, one of

the twin beings from the planet Thargon. Orostron did not agree at all. "If that it a radio station, it must

be built for interplanetary communication. Look at the way the mirrors are pointed. I don't believe that a race which has only had radio for two centuries can have crossed space. It took my people six thousand years to do it."

"We managed it in three," said (Sansur 1) mildly, speaking a few seconds ahead of his twin. Before the inevitable argument could develop, Klarten began to wave his tentacles with excitement. While the others had been talking, he had started the automatic monitor.

"Here it is! Listen!" He threw a switch, and the little room was filled with a raucous whining sound, continually changing in pitch but nevertheless retain-

ing certain characteristics that were difficult to define The four explorers listened intently for a minute; then Orostron said: "Surely that can't be any form of speech! No creature could pro-

Hansur I had come to the same conclusion

"That's a television program, Don't you think so, Klarten?"

The other agreed

"Ves. and each of those mirrors seems to be radiating a different program. I wonder where they're going? If I'm correct, one of the

other planets in the system must lie along those beams. We can soon check that." Orostron called the Sopoo and

reported the discovery. Rugon and Alveron were greatly excited, and made a quick check of the astronomical records

The result was surprising-and disappointing. None of the other nine planets lay anywhere near the

line of transmission. The great mirrors appeared to be pointing blindly into space. There seemed only one couclission to be drawn, and Klarten was

the first to voice it. "They had interplanetary communication," he said. "But the station must be deserted now, and the transmitters no longer controlled. They haven't been switched off, and

are just pointing where they were left." "Well, we'll soon find out," said Orostron, "I'm soins to land,"

He brought the machine slowly down to the level of the great metal mirrors, and past them until it came to rest on the mountain rock. A hundred yards away, a white stone building crouched beneath the maze of steel girders. It was windowless, but there were several doors in the wall facing them.

Ornstron watched his companions climb into their protective suits and wished be could follow. But summone had to stay in the machine to keep in touch with the mother structions, and they were sufficient with the control of the summon summon

of their autis. Then, each with the mode of locomotion peculiar to his race, the little party went towards the building, the Hansur twins leading and Klarten following close behind. His gravity control was apparently giving trouble, for be suddenly fell to the ground, rather to the amusement of his colleagues. Control as we them pause for a Control as we them pause for a better the control of the period of the control of the period of the control of the period of the period

So Orestron waited, with what

patience he could, while the storm rose around him and the light of the aurora grew ever brighter in the sky. At the agreed times be called the mother ship and received brief acknowledgments from Rugon. He wondered how Torkalee was faring, halfway round the planet, but he could not contact him through the crash and thunder of solar interference

It did not take Klarten and the Hansurs long to discover that their theories were largely correct. The building was a radio station, and it was deserted. It consisted of one tremendous room with a few small offices leading from it. In the main chamber, row after row of electrical equipment stretched into the distance: lights flickered and winked on hundreds of control panels, and a dull glow came from the elements in a great avenue of vacuum tubes. But Klarten was not impressed.

thousand million years old. Man. who had possessed electrical machines for only few centuries, could not compete with those who had known them for half the lifetime of the Earth. Nevertheless, the party kept their

recorders running as they explored the building. There was still one problem to be solved. The deserted station was broadcasting programs -but where were they coming from? The central switchboard had been quickly located. It was designed to handle scores of programs simultaneously, but the source of those programs was lost

in a maze of cables that vanished underground. Back in the Soooo. Rugon was trying to analyze the broadcasts and perhaps his researches would reveal their origin. It was impossible to trace cables that might lead across continents.

The party wasted little time at the deserted station. There was nothing they could learn from it, and they were seeking life rather than scientific information. A few minutes later the little ship rose Swiftly from the plateau and headed towards the plains that must lie beyoud the mountains. Less than three hours were still left to them.

As the array of enigmatic mirrors dropped out of sight. Orostron was struck by a sudden thought. Was it imagination, or had they all moved through a small angle while he had been waiting, as if they were still compensating for the rotation of the Earth? He could not be sure. The first radio sets his race had and he dismissed the matter as unbuilt were now fossilized in strata a important. It would only mean that the directing mechanism was still working, after a fashion,

They discovered the city fifteen minutes later. It was a great, sprawling metropolis, built around a river that had disappeared leaving an ngly scar winding its way among the great buildings and beneath bridges that looked very incongruous now.

Even from the air, the city looked deserted. But only two and a half hours were left-there was no time for further exploration. Orostron made his decision, and landed near the largest structure he could see. It seemed reasonable to suppose that some creatures would have sought shelter in the strongest buildings, where they would be safe The deepest coves-the heart of

until the very end.

the planet itself-would give no protection when the final catacylsm came. Even if this race had reached the outer planets, its doom would only be delayed by the few hours it would take for the ravening wavefronts to cross the Solar System.

Orostron could not know that the city had been deserted not for a few days or weeks, but for over a century. For the culture of cities, which had outlasted so many civilizations, had been doomed at last when the helicopter brought universal transportation. Within a few generations the great masses of mankind, knowing that they could reach any part of the globe in a matter of hours, had gone back to the fields and forests for which they had always longed. The new civilization had machines and resources of which earlier ages had never dreamed, but it was essentially rural and no longer bound to the steet and concrete warrens that had dominated the centuries before. Such cities that still remained were specialized centers of research, administration or entertainment: the others had been allowed to decay where it was too much trouble to destroy them. The dozen or sp greatest of all cities, and the ancient university towns, had scarcely changed and would have lasted for many generations to come. But the cities that had been founded on steem and iron and surface trans-

portation had passed with the industries that had nourished them. And so while Orostron waited in

the tender, his colleagues raced through endless empty corridors and deserted halls, taking innumerable photographs but learning nothing of the creatures who had used these buildings. There were libraries, meeting places, council rooms, thousands of offices-all were empty and deep with dust. If they had not seen the radio station on its mountain eyric, the explorare could well have believed that this world had known no life for cen-

Through the long minutes of waiting, Orostron tried to imagine where this race could have vanished. Parhans they had killed themselves knowing that escape was impossible: perhaps they had built great shelters in the bowels of the planet, and even now were cowering in their millions beneath his feet, waiting for the end. He began to fear that he would never know.

turies

It was almost a relief when at last he had to give the order for the return. Soon he would know if Torkalee's party had been more fortunate. And he was anxious to get back to the mother ship, for as the minutes passed the suspense had become more and more acute. There had always been the thought in his mind: "What if the autronomore of Kulath have made a mistake?" He would begin to feel happy when the walls of the Soooo were around him. He would be happier still when they were out in space and this ominous sun was shrinking far astern

As soon as his colleagues had entered the air lock. Orostron burled his tiny machine into the sky and set the controls to home on the Soooo, Then he turned to his

iriands.

"Well, what have you found?" he saked Klarten produced a large roll of canvas and spread it out on the

floor "This is what they were like," he -aid quietly. "Bipeds, with only two arms. They seem to have managed well, in spite of that handicap.

Only two eyes as well, unless there are others in the back. We were lucky to find this; it's about the only thing they left behind." The ancient oil nainting stared

stonily back at the three creatures regarding it so intently. By the irony of fate, its complete worthlessness had saved it from oblivion. When the city had been evacuated, no one had hothered to move Alderman John Richards, 1909-1974. For a century and a half he had been gathering dust while far away from the old cities the new civilization had been rising to heights no earlier culture had ever known.

"That was almost all we found." said Klarten. "The city must have been deserted for years. I'm afraid our expedition has been a failure. If there are any living beings on this world, they've hidden themselves too well for us to find them." His commander was forced to surree

"It was an almost impossible

task," he said. "If we'd had weeks instead of hours we might have succeeded. For all we know, they may even have built shelters under the sea. No one seems to have

thought of that." He glanged onickly at the indicators and corrected the course.

"Wa'll be there in five minutes Alveron seems to be moving rather

quickly. I wonder if Torkalee has found anything?" The Soooo was hanging a few miles above the seaboard of a blaz-

ing continent when Orostron homed upon it. The danger line was thirty minutes away and there was no time to lose. Skillfully, he maneuvered the little ship into its launching tube and the party stepped out of the air look.

There was a small crowd waiting for them. That was to be expected. but Orostron could see at once that something more than curiosity had brought his friends here. Even before a word was spoken, he linew that something was wrong. "Torkalee hasn't returned. He's

lost his party and we're going to the rescue. Come along to the control room at once "

From the beginning, Torkalee had been luckier than Orostron. He had followed the zone of twilight. keeping away from the intolerable glare of the sun, until he came to the shores of an inland sea. It was a very recent sea, one of the latest of Man's works, for the land it covered had been desert less than a century before. In a few hours

40

water was boiling and clouds of steam were rising to the skies. But they could not veil the loveliness of the great white city that overlooked the tideless see.

Flying machines were still parked neatly round the square in which Torkalee landed. They were disappointingly primitive, though beautifully finished, and depended on rotating airfoils for support. Nowhere was there any sign of life, but the place gave the impression that its inhabitants were not very far away. Lights were still shining

from some of the windows

Torkalee's three companions lost no time in leaving the machine. Leader of the party, by seniority of rank and race was T'sinadree, who like Alveron himself had been born on one of the ancient planets of the Central Suns, Next came Alarkane, from a race which was one of the voungest in the Universit and took a perverse pride in the fact. Last came one of the strange beings from the system of Palador. It was nameless, like all its kind, for it possessed no identity of its ownbeing merely a mobile but still dependent cell in the consciousness of its race. Though it and its fellows had long been scattered over the Galaxy in the exploration of countless worlds, some unknown link still bound them together as inexorably as the living cells in a human body

When a creature of Palador spoke, the pronoun it used was always "We." There was not, nor could there ever be, any first per-

44

it would be desert again, for the son singular in the language of

The great doors of the splendid building baffled the explorers, though any buman child would have known their secret. T'sinadree wasted no time on them but called Torkalee on his personal transmitter. Then the three hurried aside

ter. Then the three hurried aside while their commander maneuvered his machine into the best position. There was a brief burst of intoterbale flame; the massive steelwork flickered once at the edge of the visible spectrum and was gone. The stones were still glowing when the eager party hurried into the building, the beams of their light projing, the beams of their light; projing

ectors famning before them.

The torches were not needed.

Before them bay a great hall, glowing with light from lines of tubes along the ceiling. On either side, the hall opened out into long corridors, while straight alond a massive stairway swept majestically towards the unear floors.

For a moment T'sinadree hesitated. Then, since one way was avgood as another, he led his companions down the first corridor.

The feeling that life was near had now become very strong. At any moment, it seemed, they might be confronted by the creatures of this world. If they showed hostility—and they could scarcely be blamed if they did—the paralyzerswould be used at once.

blamed if they did—the paralyzerswould be used at once.

The tension was very great asthe party entered the first room, and only relaxed when they saw that it sitent. Lining the enormous room were thousands of metal filing cabinets, forming a continuous wall as far as the eye could reach. And that was all; there was no furniture, nothing but the cabinets and the mysterious machines.

Alarkane always the quickest of the three, was already examining the cabinets. Each held many thousand sheets of tough, thin material, perforated with innumerable holes and slots. The Paladorian appropriated one of the cards and Alarkane recorded the scene together with some close-ups of the machines. Then they left. The ereat room, which had been one of the marvels of the world meant nothing to them. No living eve would ever smain see that wonderful battery of almost human Hollerith analyzers and the five thousand million punched cards holding all that could be recorded of each man, womay and child on the planet.

It was clear what this building had been used very recently. With growing excitement, the explorers burried on to the next room. This they found to be an enormous. Illinoisers, for millions of looks lay all around them on miles and inter of selecting. Here, though the exploration of the exploratio

T'sinadree was deciding his plan of action when Alarkane drew his attention to one of the racks a hun-

dred yards away. It was hall empty, unlike all the others. Around it books lay in a tumbled beap on the floor, as if limocked down by someone in framite haste. The signs other creatures had been this way. Faint wheel marks were clearly visible on the floor to the acute sense of Alarkane, though the other could see nothing. Alarkane could even detect footprints, but knowing ormed them to could not any which formed them the could not any which formed them the could not any which

way they led.

The sense of nearness was stronger than ever now, but it was nearness in time, not in space. Alarkane voiced the thoughts of the party.

"Those books must have been valuable, and someone has come to rescue them—rather as an after-thought, I should say. That means there must be a place of refuge, e possibly not very far away. Perhaps we may be able to find some dother clues that will lead us to it."

Trisingdere agreed, but the Pala-

dorian refused to be enthusiastic.
"That may be so," it said, "but
the refuge may be anywhere on the
planet, and we have just two hours
felf. Let us waste no more time
if we hope to rescue these people."

The party burried forward once more, pausing only to collect a few books that might be useful to the scientists at Base—though it was doubtful if they could ever be translated. They soon found that the great building was composed largely of small rooms, all showing signs of recent occuration. More of them

were in a neat and tidy condition, but one or two were very much the reverse. The explorers were particularly nuzzied by one roomclearly an office of some kind-that appeared to have been completely wrecked. The floor was littered with papers, the furniture had been smashed, and smoke was pouring through the broken windows from

the fires outside. T'sinadree was rather alarmed. "Surely no dangerous animal could have got into a place like

this!" he exclaimed, fingering his naralyzer nervously. Alarkane did not answer. He began to make that annoving sound

which his race called "laughter." It was several minutes before he would explain what had amused him "I don't think any animal has

explanation is very simple. Supnose you had been working all your life in this room, dealing with endless papers, year after year. And suddenly, you are told that you will never see it again, that your work is finished, and that you can leave it forever. More than that -no one will come after you. Execution is finished. How would you make your exit, T'sinadree?"

The other thought for a moment, "Well I suppose I'd just tidy things up and leave. That's what seems to have happened in all the

other rooms." Alarkane laughed again,

4

"I'm quite sure you would. But some individuals have a different psychology. I think I should have

liked the creature that used this room."

He did not explain himself further, and his two colleagues puzzled over his words for quite a while before they gave it up.

It came as something of a shock when Torkalee gave the order to return. They had gathered a great deal of information, but had found no clue that might lead them to the missing inhabitants of this world. That problem was as baffling as ever and now it seemed that it would never be solved. There were only forty minutes left before the

Soooo would be departing. They were halfway back to the tender when they saw the semicircular passage leading down into the depths of the building. Its architectural style was quite different from that used elsewhere, done it," he said. "In fact, the and the gently sloping floor was an irresistible attraction to creatures whose many lers had grown weary of the marble staircases which only bipeds could have built in such profusion T'sinadree had been the worst sufferer, for he normally employed twelve legs and could use twenty when he was in a hurrythough no one had ever seen him perform this feat.

The party stopped dead and looked down the passageway with a single thought. A tunnel, leading down into the depths of the carth. At its end, they might yet find the people of this world and rescue some of them from their fate. For there was still time to call the mother ship if the need

arose. ASTOUNDING SCIENCE-FICTION

T'smaltre, signuled to his comunander and Torshake broughts tittle machine immediately overhead. There might nobe time the through the macace of passages, soo meticulously recorded in the Paladorian mind that there was no sibility of going acray. If speed were necessary, Torshake conwere necessary, Torshake on the part of the Bast his, way through the dozen flower above their head. In dozen case, it should not take long to find what lay at the end of the passage. It took only thirty seconds. The tunnel ended quite abruptly in a very curious eyiludrical room with magnificently padded seats along the walls. There was no way out save that by which they had come and it was several seconds before the purpose of the chamber dawned

on Alarkane's mind. If was a nity.

he thought that they would never

was suddenly interrupted by a cry from T'sinadree. Alarkane wheeled around, and saw that the entrance had closed silently behind them

Even in that first moment of panic. Alarkane found himself thinking with some admiration;

"Whoever they were, they knew how to build automatic machinery!" The Paladorian was the first to

speak. It waved one of its tendrils towards the seats

"We think it would be best to be seated," it said. The multiplex mind of Palador had already analyzed the situation and knew what was coming.

They did not have long to wait before a low-pitched hum came from a grille overhead, and for the very last time in history a human, even if lifeless, voice was heard on Earth. The words were meaningless, though the trapped explorers could guess their message clearly enough

"Chose your stations, please, and be seated."

Simultaneously, a wall panel at one end of the compartment glowed with light. On it was a simple map, consisting of a series of a dozen circles connected by a line. Each of the circles had writing alongside it, and beside the writing were two buttons of different colors.

Alarkane looked questioningly at his leader

"Don't touch them," said T'sinadree. "If we leave the controls, alone, the doors may open again." He was wrong. The engineers who had designed the automatic

have time to use this. The thought subway had assumed that anyone who entered it would naturally wish to go somewhere. If they selected no intermediate station, their destination could only be the end of the

> There was another pause while the relays and thyratrons, waited for their orders. In those thirty seconds, if they had known what to do, the party could have opened

the doors and left the subway. But they did not know, and the machines geared to a human psycholnew acted for them. The surge of acceleration was not

very great; the lavish upholstery was a luxury, not a necessity. Only an almost imperceptible vibration told of the speed at which they were traveling through the bowels of the earth, on a journey the duration of which they could not even guess. And in thirty minutes, the Songo would be leaving the Solar System.

There was a long silence in the speeding machine. T'sinadree and Alarkane were thinking rapidly. So was the Paladorian, though in a different fashion. The conception of personal death was meaningless to it, for the destruction of a single unit meant no more to the groupmind than the loss of a nail-paring to a man. But it could, though with great difficulty, appreciate the plight of individual intelligences such as Alarkane and T'sinadree, and it was

anxious to help them if it could. Alarkane had managed to contact Torkalee with his personal transmitter, though the signal was very

quickly. Rapidly he explained the situation, and almost at once the signals became clearer. Torkalee was following the path of the machine, flying above the ground under which they were speeding to their unknown destination. That was the first indication they had of the fact that they were traveling at nearly a thousand miles an hour, and very soon after that Torkalee was able to give the still more disturbing news that they were rapidly approaching the sea. While they were beneath the land, there was a hope, though a slender one, that they might stop the machine and escape, But under the ocean-pot all the

perfect trap.

T'sinadree had been examining the wall map with great attention. Its meaning was obvious, and along the line connecting the circles a tiny spot of light was crawling. It was already halfway to the first of the stations marked.

"I'm going to press one of those buttons," said T'sinadree at last. "It won't do any harm, and we may learn something."

"I agree. Which will you try fores?"

"There are only two kinds, and it won't matter if we try the wrong one first. I suppose one is to start the machine and the other is to stop it."

Alarkane was not very hopeful.
"It started without any button
pressing," he said. "I think it's
nescen party

the completely automatic and we can't the control it from here at all." T'sinadree could not agree.

"These buttons are clearly associated with the stations, and there's no point in having them unless you can use them to stop yourself. The only question is, which is the right one?"

His analysis was perfectly correct. The machine could be stopped at any intermediate station. They had only been on their way ten minutes, and if they could leave now, no harm would have been done. It was just had luck that T sinadree's first choice was the

wrong button.

sea. There cannot be another stop for nearly a thousand miles."

Alveron had given up all hope of

Alveron had given up all bage of inding life on this world. The Spoon had rearned over half the Spoon had rearned over half the Janke, never staying long in one place, descending ever and again in an effort to attract attention. There had been no response; Earth Alveron, they must have hidden Alveron, they must have hidden Alveron, they must have hidden themselves in its depths over the form would be none the less certain the staying the spoon would be none the less certain the staying the spoon would be none the less certain the staying the staying the staying the staying the staying the staying the stay of the staying th

doom would be none the less certain.
Rugon brought news of the disaster. The great ship ceased its fruitless searching and fled back through the storm to the ocean above which Torkalee's little tender was still following the track of the horized machine.

The scene was truly terrifying. Not since the days when Farth was born had there been such sens on this. Mountains of water were racing before the storm which had now reached velocities of many hundred miles an hour. Even or this distance from the mainland the air was full of flying debris-street. fragments of houses, sheets of metal, anything that had not been anchored to the ground. No airhorne machine could have lived for a moment in such a gale. And ever and again even the roar of the wind was drowned as the vast watermountains met head-on with a crash

that seemed to shake the sky. Fortunately, there had been no serious earthouskes yet. Far beneath the bed of the ocean, the wonderful piece of engineering which had been the world president's private vacuum-subway was still working perfectly, unaffected by the tumuit and destruction above. It would continue to work until the last minute of the Earth's existence, which if the astronomers were right, was not much more than fifteen minutes away-though precisely how much more. Alveron would have given a great deal to know. It would be nearly an hour before the trapped party could reach land and even the slightest

hope of rescue.

Alveron's instructions had been precise, though even without them

10

he would never have dreamed of taking any risks with the great machine that had been intrusted to his care. Had he been human, the decision to abandon the trapped members of his crew would have been desperately hard to make Port he came of a race for more sensitive than Man, a race that so loved the things of the spirit that long ago. and with infinite reluctance, it had taken over control of the Universe since only thus could it be sure that instice was being done. Alveron would need all his superhuman gifts to carry him through the next few

hours.

Meanwhile, a mile below the bed
of the ocean Alarkane and T sitadree were very busy indeed with
their private communicators. Fifteen minutes is not a long time in
which to wind up the affairs of a
fifetime. It is indeed, scarcely long
conoght to dictate more than a few
of those farewell messages which
at such moments are so much more
at such moments are so much more

important than all other matters.
All the white the Padadorian had remained silent and unctionless, saying not a word. The other two, resigned to their fate and engrossed in their personal affirir, had given it no thought. They were startled when suddeduly it began to address them in its peculiarly passionless voice.

"We perceive that you are making certain arrangements concerning your anticipated destruction. That will probably be unnocessary. Captain Alveron hopes to rescue us if we can stop this machine when we reach land again." Both T'sinadree and Alarkane were too surprised to say anything for a moment. Then the latter gasped. "How do you know?"

gasped, "How do you know?"

It was a foolish question for he remembered at once that there were several Pladdorians—if one could use the phrate—in the Socoo, and consequently their companion knew everything that was happening in the mother ship. So he did not wait for an answer but continued: "Alveron can't do that! He daren't take such a risk!"

"There will be no risk," said the Paladorian. "We have told him what to do. It is really very simple."

Alarkane and T'sinadree looked at their companion with something approaching awe, realizing now what must have happened. In moments of crisis, the single units comprising the Paladorian mind could link together in an organization no less close than that of any physical brain. At such moments they formed an intellect more nowerful than any other in the Universe All ordinary problems could be solved by a few hundred or thousand units. Very rarely millions would be needed, and on two historic occasions the billions of cells of the entire Paladorian consciousness had been welded together to deal with emergencies that threatened the race. The mind of Pala-dor was one of the greatest mental resources of the Universe; its full force was keldom required, but the knowledge that it was available was supremely comforting to other

races. Alarkane wondered how many cells had co-ordinated to deal with this particular emergency. He also wondered how so trivial an incident had ever come to its atten-

tion at all To that question be was never to know the answer though he might have ruested it had be known that the chillingly remote Paladorian mind possessed an almost human streak of vanity. Long ago, Alarkane had written a book trying to prove that eventually all intelligent races would sacrifice individual consciousness and that one day only group-minds would remain in the Universe. Palador, he had said. was the first of those ultimate intellects, and the vast, dispersed mind had not been displeased.

They had no time to ask any further questions before Alveron himself began to speak through their

"Alveron calling! We're staving on this planet until the detonation wave reaches it so we may be able to rescue you. You're heading towards a city on the coast which you'll reach in forty minutes at your present speed. If you cannot stop yourselves then, we're going to blast the tunnel behind and ahead of you to cut off your nower. Then we'll sink a shaft to get you outthe chief engineer says he can do it in five minutes with the main projectors. So you should be safe within an hour, unless the sun blows up before."

"And if that happens, you'll be destroyed as well! You mustn't take such a risk!" "Done let that worsy you; we're perfectly safe. When the sam detonates, the explosion ware will take several minutes to rise to its maximum. But apart from that, we're on the night side of the planet, behind an eighth side of the planet, behind an eighth side of the planet, behind an eighth of the planet, behind an eighth of the planet. Under our maximum of the planet will accelerate out of the Solar System, keeping in the shadow of the planet. Under our maximum drive, we will accelerate out of the Solar out of the planet. Under our maximum trive, we will reach the vedocity of light of the planet. Under the planet under the planet. Under the planet under the planet. Under the planet under the planet under the planet under the planet. The planet was not the two grammes have a gramme harm the planet under the pla

us then."

T'sinadree was still afraid to hope. Another objection came at once into his mind.

"Yes, but how will you get any warning, here on the night side of the clanet?"

"Very easily," replied Alverson.
"This world has a moon which is now visible from this hemisphere.
We have telescopes trained on it.
If it shows any sudden increase in brilliance, our main drive goes on automatically and we'll be thrown out of the system."

The logic was flawless. Alveron, cautious as ever, was taking no chances. It would be many minutes be fore the eight-bousand-mile shield of rock and metal could be destroyed by the fires of the exploding sun. In that time, the \$9000 could have reached the safety of the velocity of library.

Alarkane pressed the second button when they were still several miles from the coast. He did not expect anything to happen theo.

..

re assuming that the machine could m not stop between stations. It ill seemed too good to be true when, a few minutes later, the machine's stat, slight vibration died away and they be count to a half.

The doors slid silently apart. Even before they were fully open, the three had left the compartment. They were taking no more chances. Before them a long tunnel stretched into the distance rising slowly out of sight. They were starting along it when suddenly Alveron's voice called from the communicators. "Stay where you are! We're go-

ing to blast!"

The eround shuddered once, and

far ahead there came the rumble of falling rock. Again the earth shook—and a hundred yards ahead the passageway vanished abruptly. A tremendous vertical shaft had been cut clean through it.

The party hurried forward again until they came to the end of the corridor and stood waiting on its p. The shaft in which it ended descended into the earth as far as the torches could have when the some clouds feel between the correct of the torches could have when the correct of the correc

ing cherry red.

A dark shape detached itself
from the mother ship and dropped
swiftly towards the ground. Torkalee was returning to collect his
friends. A little later, Alveron

greeted them in the control room He waved to the great vision screen and said quietly:

"You see, we were only just in time."

The continent below them was slowly settling beneath the milehigh waves that were attacking its coasts. The last that anyone was ever to see of Earth was a great plain, bathed with the silver light of the abnormally brilliant moon, Across its face the waters were pouring in a glittering flood towards a distant range of mountains. The sea had won its final victory, but its triumph would be short-lived for soon sea and land would be no more. Even as the silent party in the control room watched the destruction below, the infinitely greater catastrophe to which this was only the prelude came swiftly

upon them. It was as though dawn had broken suddenly over this moonlit landscape. But it was not dawn: it was only the moon, shining with the brilliance of a second sun. For perhaps thirty seconds that awesome, unnatural light burnt fiercely on the doomed land beneath. Then there came a sudden flashing of indicator lights across the control board. The main drive was on. For a second Alveron glanced at the indicators and checked their information. When he looked again at

the screen. Earth was already gone. The magnificent, desperately overstrained generators quietly died when the Soooo was passing the orbit of Persephone. It did not matter the sun could never harm

them now, and although the ship was speeding helplessly out into the lonely night of interstellar space, it would only be a matter of days be-

fore rescue come. There was irony in that. A day ago, they had been the rescuers, going to the aid of a race that now no longer existed. Not for the first time Alveron wondered about the world that had just perished. He tried, in vain, to picture it as it had been in its glory, the streets of its cities thronged with life. Primitive though its people had been, they might have offered much to the Universe later in history. If only they could have made contact! Regret was useless; lone before their coming, the people of this world must have buried themselves in its iron heart. And now they and their civilization would remain a mystery for the rest of time.

gon's entrance. The chief of communications had been very busy ever since the take-off, trying to analyze the programs radiated by the transmitter Orostron had discovered. The problem was not a difficult one, but it demanded the construction of special equipment. and that had taken time. "Well, what have you found?"

Alveron was glad when his

thoughts were interrupted by Ru-

asked Alveron. "Ouit a lot." replied his friend.

"There's something mysterious here. and I don't understand it. "It didn't take long to find how the vision transmissions were built

up and we've been able to convert

very high buildings. The cameras

were rotating continuously to give panoramic views. In the programs we've recorded there are about

twenty different scenes.

"In addition, there are a number of transmissions of a different kind, neither sound nor vision. They

neither sound nor vision. They seem to be purely scientific—possibly instrument readings or something of that sort. All these programs were going out simultane-

ously on different frequency hands. "Now there must be a reason for all this. Orostron still thinks that the station singley wann't switched off when it was deserted. But these aren't the sort of programs such a station would normally radiate at all it was certainly used for interplanetary relaying.—Klarten was quite right there. So these people must have crossed space, since some the time of the bast survey. Don't you agree," Alveron was following intently. Alveron was following intently.

Alveron was following intently.

"Yes, that seems reasonable enough. But it's also certain that the beam was pointing to none of the other planets. I checked that

"I know," aid Rugon. "What I want to discover is why a giant in-terplanetary relay station is busily transmitting pictures of a world about to be destroyed—pictures that would be of immense interest to scientific and astronomers. Someone had gone to a lot of trouble to arrange all those panottened that those beams were going somether."

Alveron started up.

"Do you imagine that there might be an outer planet that hasn't been reported?" he asked. "If so, your theory's certainly wrong. The beam wasn't even pointing in the plane of the Solar System. And even if it were—just look at this."

He switched on the vision acrees and adjusted the controls. Against the velvet curtain of space was hanging a blue-white sphere, apparently composed of many concernic shells of incandescent gas. Even though its immorase distance made all movement invisible, it was clearly expanding at an enormous rate. At its center was a blinding point of light—the white dwarf start that the sun had now discounter that the sun had now the start of the control of the c

"You probably don't realize just how big that sphere is," said Alveron. "Look at this."

He increased the magnification until only the center portion of the nova was visible. Close to its heart were two minute condensations, one on either side of the nucleus. "Those are the two giant planets

of the system. They have still managed to retain their existence—after a fashion. And they were several hundred million miles from the sun. "The nova is still expanding but it's already twice the size of the solar System."

Rugon was silent for a moment.
"Perhaps you're right," he said,
rather grudgingly. "You've disposed of my first theory. But you
still haven't satisfied me."

He made several swift circuits of the room before speaking again. Alveron waited nationally, he knew the almost intuitive powers of his friend, who could often solve a problem when mere logic seemed insufficient.

Then, rather slowly, Rugon be-

gan to speak again. "What do you think of this?" he said. "Suppose we've completely underestimated this people? Orostron did it once-he thought they could never have crossed space, since they'd only known radio for two centuries. Hansur II told me that. Well. Orostron was ouite wrong. Perhaps we're all wrong. I've had a look at the material that Klarten brought back from the transmitter. He wasn't impressed by what he found, but it's a marvelous achievement for so short a time. There were devices in that station that belonged to civilizations thousands of years older. Alexron. can we follow that beam to see mbere it leadefor

Alveron said nothing for a full minute. He had been more than half expecting the question, but it was not an easy one to answer. The main generators had gone completely. There was no point in trying to repair them. But there was still power available, and while there was power, anything could be done in time. It would mean a lot of improvisation, and some difficult maneuvers, for the ship still had its enormous initial velocity. Yes, it could be done, and the activity would keep the crew from becoming further depressed, now that the reaction caused by the mission's failure had started to set

in. The news that the nearest heavy repair ship could not reach them for three weeks had also caused a slump in morale.

canotic a shapp in moraci.

The engineers, as usual, made a tremendous fuss. Again as usual, they did the job in half the time they did the job in half the time that had dismissed as being above the properties of the properties

The manetwer took three days, but at the end of that time the ship was limping along a course parallel to the beam that had once come from Earth. They were heading out into emptiness, the blazing sphere that had been the sun dwindling slowly belind them. By the standards of interstellar flight, they were almost stationard.

they were annows standourly.

For hours kugens strained settletor beams far abread into space.

There were certainly no planets
within many light-years; there was
no doubt of thus. From time to
time Alveron came to see him and
always he had to give the same reply: "Nothing to report." About
a fifth of the time Rugon's intuition
let him down badly; he began to
wonder it this were such an occa-

Not until a week later did the needles of the mass-detectors quiver feebly at the ends of their scales. But Rugon said nothing, not even to bis captain. He waited until he was sure, and he went on waiting until even the short-range scanners began to react, and to build up the first faint pictures on the vision screen. Still he waited patiently until he could interpret the images. Then, when he knew that his wildest fancy was even less than the truth, he called his colleagues into the control rows.

The picture on the vision screen was the familiar one of endless star fields, sun beyond san to the very limits of the Universe. Near the center of the screen a distant nebula made a patch of baze that

was difficult for the eye to grasp. Rugon increased the magnification. The stars flowed out of the field; the little nebula expanded until it filled the screen and then it was a nebula no longer. A si-

g multaneous gasp of amazement s came from all the company at the e sight that lay before them.

Lying across longue after league of spec, ranged in a wast three dimensional array of rows and columns with the precision of a marching army, were thousands of tiny pennis of light. They are moving swiftly; the whole immensation began to drift off the serven and his commades watched, the formation began to drift off the screen and Resen had to recenter the controls.

After a long pause, Rugon started to speak, "This is the race," he said softly, "that has only known radio for two centuries—the race that we believed had crept to die in the heart of its plant. I have examined

To were period to the design and the test to the his claims, the tree of the his claims, the tree of the his claims, the tree the test gots held and extra currier, may, as well and extra currier, may, as well as a second color of the test control of the test color of the test color

those images under the highest possible magnification.

sube maguncation. "That is the greates fleet of which there has even been a record." Tract is the greates a being a record and a record and a record and a record and a record as a big and a record of coarse, they are very primitive—what to suce on the screen are the jets of their rockets. Ves, they dared to use rockets to bridge interested a respect? You realize what that means. It would take them conturies to reach the nearest star. The whole rare must have enhanced on this journey in the loop that its descendants would complete it, gent

complishment, think of the ages accomplishment, think of the ages it took us to conquer space, and the longer ages still before we attempted to reach the stars. Even if we were threated with annihilation, could we have done so much is the youngest civilization in the to the country of the country of the Universe Four hundred thousand years ago it did not even exist. What will it be a million yearsfrom now?

An hour later, Orostron left the crippled mother ship to make contact with the great fleet ahead. As the little torpedo disappeared among the stars, Alveron turned to his friend and made a remark that Rugon was often to remember in the years ahead. "I wonder what they II be like "be mused. "Will they be nothing but wonderful engineers, with no art or philosophy? They're gong to have such a surprise when Orostron reaches them—I expect it will be rather a blow to their pride. It's fumpy how all isolated react think they're the only people in they continue they will be grateful to us—we're going to save them a good many hundred years."

of travel."

Alveron glanced at the Milky Way, lying like a veil of silver mist across the vision screen. He waved towards it with a sweep of a tentacle that embraced the whole circle of the Galaxy, from the Cental Planets to the Jonety suns of

the Rim.
"You know," he said to Rugon, "I

feel rather afraid of these people. Suppose they don't like our little Federation?" He waved once more towards the star-clouds that lay massed across the screen, glowing with the light of their countless

"Something tells me they'll be very determined people," he added, "We had better be polite to them. After all, we only outnumber them about a thousand million to one." Rugon laughed at his captain's fittle joke.

Twenty years afterwards, the remark didn't seem so funny.

A Son Is Born

by A. E. VAN VOGT

Van Vogt starts a new series, of a world where atomic energy is old—and science forgotten, debased to ritual. A world into which a child touched by atomic rays is born—

Bustrated by Swenson

Junior scientists stood at the bell care, however, not to be overheard ropes all day, ready to sound forth the tidings of an important birth.

By night time, they were exchanging carse jests as to the possible He was a weak and sickly fellow.

reason for the delay. They took

to the Leader household. His mother, Lady Tania, when she wakened, listened for a while to his piteous crying, then commented widly.

nis piteous crying, then commented acidly:

"Who frightened the little wretch? He seems already afraid of life."

Scientist Joyain, in charge of the delivery, considered he words dielivery considered be the word ill-omen. He had not intended to let her see the mostrosity until the following day, but now it seemed to him that he must act wirfly to avert calamity. He hurriedly sent a dozen slaw owners to wheel in the carriage, ordering them to group around it in close formation to ward off any malignant radiation that might he in the bedroom.

Lady Tania was lying, her slim body propped up in bed, when the astonishing procession started to squeeze through the door. Sile squeeze through the door. Sile swatched it with a frown of amazement and then the beginning of alarms. She had patiently borne her husband three other children, and so she knew that what she was seeting was not part of any normal observance. She was not a soft spedier creature, and even the preence of a Scientist in the room tild leading the started of the property of the leading three three countries. The solid vicentification is the solid property of the leading three three countries of the solid property of the leading three countries.

"What is going on here, Joquin?"
Joquin fluttered his head at her
in distress. Did she not realize
that every ill-tempered word spoken
at this period only doomed the
handicapped child to further disasters? He noted, startled, that she
was parting her lips to speak arabin

of the bahy.

Three swift strides he made towards the bed, and clapped his jalm over her mouth. As he had expected, the woman was too astounded by the action to utter a sound. By the time she recovered, and began to struggle weakly, the carriage was being tilted. And over his arm, she lasd her first glimpse

The gathering storm fasfed from brile eyes. After a moment, jorning neutry removed his hand from her mouth, and slowly retreated beyond the carriage. He stood there, cualing with the thought of what he had Jone, but gradually as no werlal lightning struck at him from the held, his sense of righteosaness crasserted. He began to glow inwardly and ever afterwards acred the thinnion as far as it could be saved. In the warmth of that self-concratuatory feditor, he all effective reference has deficiently referred to the saved to the saved. In the warmth of that self-concratuatory feditor, he all

most forgot the child.

He was recalled by the Lady
Tania saying in a dangerously quiet

"How did it happen?"

Joquin nearly made the mistake
of shrugging. He caught himself
in time, but before he could say
anything, the woman said, more

sharply:
"Of course, I know it's due to
the atom gods. But tehen do you

the atom gods. But tenen do you think it happened?"

Joquin was cautious. The scientists of the temples had had much experience with atomic nutation, enough to know that the controlling gods were erratic and not easily pinned down by dates. Nevertheless, mutation did not occur after an embryo baby was past the fish stage, and therefore a time limit could be estimated. Not after January, 470 A.B., and not before — He paused, recalling the approximate hirth date of the Lady

Tania's third child. He completed

his figuring aloud- "Not before 467 A.R." The woman was looking at the child now, more intently. What she saw made her swallow visibly. Joquin, watching her, thought he knew what she was thinking. She had made the mistake a few days before her confinement of boasting in a small company that four children would give her an advantage over her sister. Chrosone, who only had two children, and over her stepbrother, Lord Tews, whose acid-tongued wife had borne him three children. Now, the advantage would be theirs, for, obviously,

sise coatd have no more normal children, and they could overtake or surpass her at their leisure. There would also be many witty exchanges at her expense. The potentialities for personal embarrassment were actually almost endless. All that, Joquin read in her face,

as she stared with hardening eyes at the child. He said hurriedly: "This is the worst stage, Lady. Frequently, the result after a few months or years is reasonably—sat-

isfactory."
He had almost said "human." He

was aware of her gaze swinging towards him. He waited uneasity, but all she said finally was: "Has the Lord Leader, the child's

grandfather, been in?"
Joquin inclined his head. "The
Lord Leader saw the baby a few
minutes after it was born. His
only comment was to the effect that
I should ascertain from you, if nos-

sible, when you were affected."

She did not reply immediately, but her eyes narrowed even more. Her thin face grew hard, then harsh. She looked up at the scientists.

harsh. She looked up at the scientist at last.
"I suppose you know," she said,
"that only negligence at one of the
tennes could be reaponsible."

Josuin had already thought of that, but now he looked at her uneasily. Noftling had ever been done about previous "children of the gods," but it had been growing on him that the Linns at least regarded tifs as a special case. He said slowly: "The atom gods are inserutable."

The woman seemed not to hear. Her cold voice went on: "The child will have to be de-

stroyed, I suppose. But you may be sure that, within a month, there will be a compensatory stretching of scientific necks such as the world has not seen in a generation." She was not a pleasant person

when roused, the Lady Tania Liun.
daughter-in-law of the Lord
Leader.

It proved easy to trace the source

of the mutation. The previous summer, Tania, tiring of a holiday on one of the family's west coast estates, returned to the capitol bafore she was expected. Her husband, General of the Realm Cree Linn, was having extensive alterations made to the Hill Palace. No invitation was forthcoming from her sister at the other end of the city, or from her stepenother-in-low the wife of the Lord Leader Tania perforce, moved into an apartment

though still maintained by the state. had not been used as a residence for several years. The city had grown immense since it was built. and long since the commercial houses had crowded around it. Ducto a lack of foresight, by an earlier generation, title had not been taken to the lands surrounding the palace, and it had always been deemed

This assortment of buildings,

unwise to seize them by force. There was one particularly annoving aspect of the failure to realize the profitable potentialities of the area. This was the scientists' temple that towered in the shelter of one wing of the palace. It had caused the I adv Tania no end of heartache the previous summer. On taking up residence, she discovered that the only habitable apartment was on the temple side, and that the three most gorgeous windows faced directly onto the blank lead walls of the temple.

The scientist who had built the temple was a member of the Rabeint group hostile to the Linns It had titillated the whole city when the site was made known. The fact that three acres of ground were available made the affront obvious The agents of the Lord Leader

It still rankled.

discovered at the first investigation that one small area of the lead wall of the temple was radioactive. They were unable to determine the reason for the activity, because the wall at that point was of the reunited thickness. But the fact was what they reported to their master. Before midnight of the second day after the child was born, the decision was in the making.

Shortly before twelve, Scientist longin was called in, and told the trend of eventy. Once more he took his life in his hands.

"Leader," he said, addressing the great man direct, "this is a grave error into which your natural irritation is directing you. The scienrists are a group, who, having full control of atomic energy dispensation, have developed an independent attitude of mind, which will not take kindly to punishments for accidental crimes. My advice is, leave the boy alive, and consult with the Scientists' Conneil I will advise them to remove the temple of their own volition and I feel sure they will agree." Having spoken. Toomin glanced

at the faces before him. And realized that he had made a mistake in his initial assumption. There were two men and three women in the room. The men were the grave, lean Lord Leader and the plumpish Lord Tews who was the Lady Leader's eldest son by her first marriage. Lord Tews was acting Generol of the Realm in the absence of . Lord Cree, Tania's husband, who was away fighting the Venusians on

Venus. The women present were the Lady Leader Linn, wife of the Lord Leader, and stepmother-inlaw to the two other women, Chrosone, Tania's sister and Lady Tania, still in bed. The Lady Tania

and her sister were not on speaking terms, for a reason that need not be

gone into here. Joquin assumed that these five had called him for consultation, as they had on past occasions. Now, looking at them, realization came that their interest in him was psychological rather than logical. They listened intently to his words, but what he said apparently merely confirmed their previously held opinion.

Lord Tews looked at his mother, a faint smile on his plumpish face. She half lowered her eyelids. The two sisters remained frozen faced, staring at Joquin. The Lord Leader ended the tension by nodding a dismissal to the scientist.

Joquin went out, quivering. The wild idea came, to send a warning to the endangered temple scientists. But he quickly abandoned that as honeless. No message from him would be allowed out of the palace. He retired finally, but he was un-

able to sleep. In the morning, the fearful rescript that he had visualized all through the night was posted on the military board, for all to read. Joquin blinked at it palely. It was simple and without qualification.

It commanded that every scientist of the Raheinl temple was to

be hanged before dusk. The property was ordered seized, and the buildings razed to the ground. The three acres of temple land were to be converted into a park,

It did not say that the park was to be added to the Town Palace of the Linns, though this later turned

out to be the fact. The rescript was signed in the firm hand of the Lord Leader him-

self. Reading it, Joquin recognized that a declaration of war had been made

against the power of the temple ecientiste The Scientist Alden was not a

man who had premonitions. And certainly he had none as he walked slowly along towards the Raheinl temple.

The morning glowed around him. The sun was out. A gentle breeze blew along the avenue of palms which stalked in stately fashion past his new home. In his mind was the usual cozy kaleidoscope of happy reminiscences, and a quiet joy that a simple country scientist had in only ten years become the chief

scientist of the Raheinl temple. There was but one tiny flaw in that memory, and that was the real reason for his swift promotions. More than eleven years ago, he had remarked to another junior that, since the gods of the atom had yielded certain secrets of mechanical power to human beings, it might he worthwhile to carole them by experimental methods into revealing others. And that, after all, there might be a grain of truth in the vague legends about cities and planets ablaze with atomic power

and light.

Alden shuddered involuntarily at the brief remembrance. It was only gradually that he realized the extent of his blaspheny. And when

extent of his blasphemy. And when the other junior coolly informed him the following day that he had told the chief scientist—that had seemed like the end of all his hopes. Surprisingly, it turned out to be

the beginning of a new phase in his career. Within a month be was called for his first private conversation with a visiting scientist, Joquin, who lived in the palace of the Lines.

"It is our policy," Joquin said,
"to encourage young men whose
thoughts do not move entirely in a
groove. We know that radical ideas
are common to young people, and
that, as a man grows older, he attains a balance between his inward

self and the requirements of the world.
"In other words," the scientist finished, smiling at the junior, "have your thoughts but keep them to

yourself."

It was shortly after this that Alden was posted to the east coast. From there, a year later, he west to the capital. As he grew older, and gained power, he discovered that radicalism among the young men was nowth rarer than Josuin

had implied.

The years of ascendancy brought awareness of the foolishness of what he had said. At the same time, he felt a certain pride in the words, a feeling that they made him

different" from, and so superior to, the other scientists.

As chief he discovered that radicalism was the sole vardstick by which his superiors judged a candidate for promotion. Only those recommendations which included an account of unusual thinking on the part of the aspirant, however slight the variance from the norm, were ever acted upon, The limitation had one happy effect, In the beginning, his wife, auxious to be the power behind the power at the temple declared herself the sole arbiter as to who would be urged for promotion. The young temple poets visited her when Alden was not around, and read their

songs to her privately.

And then they discovered that her promises meant nothing. Their divisits ceased. Alden had peace in this home, and a wife suddenly bedone considerably more affectione ate.

His reverie ended. There was a crowd ahead, and cries. He saw that people were swarming around the Raheinl temple. Alden thought blankly, "An accident?"

He hurried forward pushing through the outer fringes of the throng. Auger came at the way individuals resisted his advance. Didn't they realize that he was a chiefe s'ceinsti? He saw mounted palace guardsmen urging their horses along the edge of the crowd a few score feet away, and he had his mouth open to call on them to assist him, when he saw something that stopped his words in his throat.

temple proper. In his embayor to move, his gaze flicked over the surrounding park.

Five of Rosamind's young poets were hanging from a tree limb at the edge of the temple grounds farthest from the temple. From a stouter tree nearby, six juniors and three scientists were still kicking sasmodically.

As Alden stood paralyzed, a dreadful screaming came from four initiates whose necks were just being fitted with rope halters.

The screaming ended, as the wagon on which they were standing was pulled from under them.

The Lord Leader walked the streets of Linn. The downtown markets were crowded with traders from the hills and from across the lake, and there was the usual pack of wide-eyed primitives from the other planets. It was no effort at all to start a conversation.

He talked only to people who showed no sign of recognizing the unshaven man in the uniform of a private soldier as their ruler. It didn't take long to realize that the thousand persuasive men he had sent out to argue his side of the hangings were doing yeoman service. No less than three of them anproached him during the course of the afternoon, and made skillful propagnada remarks. And the five farmers, three merchants and two laborers, to whom he talked, all answered his rough criticism of the Lord Leader with pro-government catchphrases they could only have heard from his own men.

It was gratifying, he told himself, that the first crisis he had forced was turning out so well.

The Linnan empire was only a generation out of the protracted civil war that had brought the Linn family to the leadership. His tax collectors were still finding the returns lean. And trade, though it was reviving swiftly in Linn itself, was making a much slower recovery in other cities, which were not favored by special exemptions.

Several wars of conquest were under way, three of them on Venus against the Venusian tribes. Ostensibly, these wars were being fought to punish the tribes for their radis against Earth. But the Lord Leader knew of at least two more important reasons. First, there was important reasons. First, there was proported, were still in a dangerously revolutionary mood. And second, he hoped to replenish the treasury

with foot from conquered cities. The Lord Leader paused mentally and physically before the open air shop of a dealer in ceramics. The man had the Linnan cast of feature and was obviously a citizen, or he wouldn't be in business. Only the opinions of citizens mattered. This one was in the throes of mak-

This one was in the throes of making a sale.

While he waited, the Lord Leader thought of the temples. It seemed the that the rejection in asset

thought of the temples. It seemed clear that the scientists had never recovered the prestige they had lost during the civil war. With a few exceptions they had supported Raheini until the very day that he was captured and killed. (He was

chopped into pieces by soldiers wielding meat axes.) The scientists promptly and collectively offered an oath of allegiance to the new regime, and he was not firmly enough entrenched in power to re-

fuse.

Be never forgot, however, that their virtual monopoly of atomic energy had nearly re-established the corrupt republic. And that, if they had succeeded, it was he who would

had succeeded, it wa have been executed.

The merchant's sale fell through the walked over grumpily, but at that moment the Lord Leader noticed a passerby had paused, and was staring at him with half recognition.

The Lord Leader without a word to the merchant turned hastily, and hurried along the street into the gathering dusk.

The members of the Scientists Council were waiting for him when, satisfied that his position was inassailable, he returned finally to the polace.

It was not an easygoing gathering. Only six of the seven memlers of the council of scientists were researd. The seventh, the poet and historian, Kourain, was ill, so Joquin reported, with fever. Actually, he had suffered an attack of acute causion on hearing of the hangings that morning, and had hastily set out on a tour of distant

temples.

Of the six, at least three showed by their expressions that they did not expect to emerge alive from the palace. The remaining three

were Mempis, recorder of wars, a bold, white-laired old man of nearly eighty: Teear, the logician, the wizard of numbers, who, it was said, had received some of his information about complicated numbers from the gods themselves; and, finally, there was Joquin, the persuader, who, for years, had acted as liaison between the remotes and

the government.

the government. The Lord Lender surveyed his audience with a jaundiced eye. The years of success laid given him a sardonic mice, that even sculptors could not endicate from his statute without threatening the resemblance. He was about fifty years old at this time, and in remarkably good health. Be began with a cold, considered and devastating attack on the Rabeilt tenule. He finished that bake heliot them to the control of the resemblance of the control of the resemblance of the rese

of his speech with:

"Tomorrow, I go before the
Patronate to justify my action
against the temple. I am assuming
that they will accept my explana-

For the first time, then, he smiled, bleakly. No one knew better than he or his audience that the slavish Patronate dared not even blink in a political sense without his permission.

"I am assuming it," he went on,
"because it is my intention simultaneously to present a spontaneous
petition from the temples for a re-

petition from the temples for a reorganization."

The hitherto silent spectators stirred. The three death-expecting members looked up with a varue

tion !

three, middle-aged Horo, said sought to purchase it under the eagerly: government regulations.

"Your excellency can count upon us for-"

He stopped because Mempis was glaring at him, his slate-blue eyes raging. He subsided, but gradually his courage returned. He had made his point. The Lord Leader must

know that he was willing. He experienced the tremendous inner easing of a man who had man-

aged to save his own skin. Joquin was saying suavely, "As Horo was about to state, we shall

be happy to give your words a respectful bearing." The Lord Leader smiled grimly. But now he had reached the crucial

part of his speech, and he reverted to legalistic preciseness. The government-he said-was prepared at last to split the temples into four separate groups as had

been so long desired by the scientists. (This was the first they had heard of the plan, but no one said anything.) As the scientists had long urged, the Lord Leader went on, it was ridiculous that the four atom gods. Uranium, Plutonium, Radium and Ecks should be worshiped in the same temples. Accordingly, the scientists would divide themselves into four separate organizations splitting the available temples evenly among the four

groups. Each group would give itself to the worship of only one god and his attributes, though naturally they would continue to perform their practical functions of supplying transmitted end-nower to all who

Each group would be headed, not by a council of equals as was the temple system at present, but by a leader for whom an appropriate

title must be selected. The four separate temple leaders would be appointed for life by a joint committee of eovernment and temple delegates. There was more, but they were

details. The council had its ultimatum. And Ioquin at least cherished no illusions. Four temple groups, each ruled by a willful scientist, responsible to no one except perhaps the Lord Leader. would end forever any hones the more enlightened scientists entertained

He rose hastily, lest one of the fearful councilors should speak first. He said gravely: "The council will be very happy

to consider your offer, and feels itself privileged to have in the goveroment a lord who devotes his obviously valuable time to thoughts about the welfare of the temples, Nothing could..."

He had not really expected to manage a postponement. And he didn't. He was cut off. The Lord Leader said with finality:

"Since I am personally making the announcement in the Patronate chamber tomorrow, the Scientists Council is cordially invited to remain in the palace to discuss details of reorganization. I have assumed this will require anywhere from a week to a month or even longer, and I have had apartments assigned for your use." He clapped his hands. Doors

opened. Palace guards came in. The Lord Leader said:

"Show these honored gentlemen to their quarters?

Thus was the council imprisoned.

Scientist Alden, tottered through the crowd before the Raheinl temple on legs that seemed made of dough. He bamped into people. and staggered like a drunken man, but he was only dimly aware of his

evrations If he had been the only person in the group reacting, he would have been marked instantly, and dragged off to the gibbet. But the executions caught the throng by surprise. Each new spectator cannally are proaching to see what was going on suffered his own variation of tremendous shock. Women fainted. Several men vomited, and others stood with glazed eyes.

As he approached one trailing end of the crowd. Alden's brain began to trickle back into his head. He saw an open gate; and he had darted through it, and was floating-that was the new sensation in his less_through the underbrush when it struck him that he was inside the grounds of the Town palace of Lord and Lady Cree Linn.

That brought the most terrible moment of the morning. Trapped. and of his own doing. He collapsed in the shelter of an ornamental shrub, and lay in a half faint of fright, Slowly, he grew aware that there was a long, low

outhouse ahead, and that trees would shelter him most of the way. He recognized that he could not safely hope to return the way he had come, nor dared he remain where he was. He rose studily to his feet, and the gods were with him. He found himself shortly cronching in the long parrow hay storeroom adjoining the stables.

It was not a good hiding place. Its width was probibitively confining, and only by making a tunnel in the hav near the door farthest from the stables did he manage to conneal bimself

He had barely settled down when one of the stable doors a dozen feet to his right opened. A four-property fork flashed in a leisurely fashion. and withdrew transporting a bundle of have

With a casual kick, the stable hand slammed the door shut, and there was the sound of retreating footsteps. Alden lay, scarcely breathing. He was just beginning to emerge from his funk a few minutes later, when, bana! another door opened, and another fork gathered its hav, and departed.

That was his morning, and yet, despite the repeated peryous shocks. by noon his mind had almost resumed normal functioning. He had his first theory as to why he had escaped the round-up that had caught the others. Only two weeks before he had moved to his new residence on the Avenue of Palms. The soldiers must have proceeded to his old address, and then had to cross the city to his new home, with the result that he had left the house by the time they arrived.

Of such tenuous fabrics the patterns of his escape were worzer. Alden shivered, and then, slowly, anger built up inside him, the deadily, gathering anger of a man wrougly persecuted. It was a fury that braced him for eventualities, and be was able at last to think with a clear-cut logic of what he must do.

Obviously, he could not remain within the grounds of the Town palace. Odd little memories came to his aid, things he had observed in earlier days without being aware that he did so. He recalled that are cevery few nights hay ricks turned into the palace gates. Judging by the empthess around him, a new sample must be almost due.

He must leave before the afternoon was out. He began to struggle along the

line of hay to the right. There was a gate on that side, and he remembered having once glimpsed the stables through it while taking a walk

By sneaking out of the end door and around to the side of the stable, and then through that gate— If only he could find another set of clothes— Surely, there would be work clothes hanging up in the stables, preferably in view of the long hair that scientists affected, a

woman's overdress—
He found what he wanted in the right end of the stable, which was devoted to milk cows. The animals and he were quite alone while he arrayed himself in the raiment that

se the milkmaids pulled over their pretty dresses when they did their thores.

The Town palace, after its brief flurry the year before as a Linn residence, had reverted swiftly to its role of agricultural, industrial and clerical center. There were guards within sight of the gate, but they did not bother to question a rather stocky woman slave, who went out with a decisive manner as if she had here sent on an errand by a sure-

i rior.

It was late afternoon when Alden
presented himself at the Covis temple. He was admitted immediately
by the astonished junior to whom
le revealed his identity.

On the fourth day, the baby was still alive. The main reason was that Tania could not make up her

"I've had the turnoil of birth," she said savagely, "and no woman in her right senses nullifies that casually. Besides..."

She stopped there. The truth was that, in spite of immunerable disadvantages, she could imagine certain uses for a son whom the gods had molded in their peculiar fashion. And in this regard, the urgings of Joquin were not without their effect. Joquin spent most of the fourth morning on the subject.

"It is a mistake," he said, "to assume that all the children of the gods are idiots. That is an idle tale of the witless mob, which pursues these poor creatures along the street. They are not given an opportunity for education, and they are constantly under pressures so great that it is little wonder few of them ever attain the dignity and sense of mature development."

His arguments took on a more personal flavor. "After all," he said-oftly, "he is a Linn. At worst, you can make of him a trustworthy aide, who will not have the same tendency to wander off to live his own life as will your normal children. By keeping him discreetly in the background, you might acquire that hest of all possible slaves.

a devoted son.

Joquin knew when to stop pushing. The moment he noticed from the thoughtful narrowing of the woman's eyes that his arguments were weighing with her, he decided to leave her to resolve the doubts that still remained. He withdrew

smoothly, and attended the morning court of the Lord Leader—and there once more urged his suit.

The great man's eyes were watchful as Joquin talked. Gradually, his satiric countenance grew puzzled. The Lord Leader interruted

at last:
"Old man," he said curtly, "what
is your purpose in thus defending
the right to life of a freak?"

Tomin had several reasons, one

Joyain had several reasons, one of them almost purely personal, and another because he believed that the continued existence of the hally might, however slightly, be an advantage to the temples. The hogh's birth had precipitated a crisis. Its death would merely aftern that crisis. Conversely, if it remained alive, the reason for the

o ferocious reaction of the Linns w would be negated to some small de-

He had no intention of stating that particular reason, and he did not immediately mention his personal hope about the haby. He said instead:

"Never before has a child of the gods been deliberately put to death. It was always assumed the gods had their own obscure purpose in creating monsters in human form. Do we dare test at this time that such is or is not the situation?"

It was an argument that made the other man stare in astonishment. The wars the Lord Leader had fought had thrown him into contact with advanced thinkers and he had come to regard the gods as a means for keeping his rebellious subjects under control. He did not also that the state of the sta

But he respected this scientist. He climbed to his feet, and walking down the steps, drew Joquin aside.

ing down the steps, drew Joquin aside.

"Do you actually," he asked, "believe what you are saying?"

The question was an uncomfort-

The question was an uncomfortable one. There was a time in Joquin's life when he had believed nothing. Slowly, however, certain things he had observed had brought a half conviction that the mighty invisible force given forth by the tiniest radioactive substance could have no other explanation. He said carefully:

"In my travels as a young man, I saw primitive tribes that worshined rain ends river ands tree gods and various animal gods. And I saw more advanced races, some

of them here on Earth, whose deity was an invisible omnipotent being who lives somewhere in space in a place called heaven. All these things I observed, and in a similar fashion I listened to each group's particular account of the beginning of the Universe. One story has it that we all came from the mouth of a snake. I have seen no such snake. Another story is that a great flood deluged the planets. though how this could have been done with the available water, I do not know. A third story is that

man was created from clay and woman from man." He looked at his hearer. The Lord Leader nodded. "Continue." "I have seen people who worshiped fire, and I have seen people who worshiped water. And then, as have so many others before me. I finally visited the valleys where our own gods are said to dwell. I discovered their residences on every planet, vast, desolate areas

miles deep and miles long and wide. And in these areas, I saw from a safe distance behind lead embankments the incredible bright fires that still burn with unending fury in those fantastic deeps of Earth. "'Truly.' I thought to myself. the rods, Uranium, Radium, Pluto-

74

I decided 'no one in his right senses would do anything to offend them.' " The Lord Leader, who had also

examined some of the homes of the gods in the course of his peregrinations, said, "Hm-m-m?" He had no time then for further

comment. From somewhere--it seemed terribly near-there was a sharp sound louder than the loudest thunder that had ever bellowed from the skies. It was followed half a minute later by a roar so loud, so furious, that the palace floor trembled.

There was a pregnant pause, not silent From all directions came the sound of windows shattering with a thousand tinkling overtones. And then, that disturbance was overwhelmed by a third evolution. followed almost instantly by a fourth.

This last was so vast a sound that it was clear to everybody that the end of the world was imminent. When Alden entered the great

Covis temple on the afternoon of the third day after the birth of the Linn baby, he was a tired, hungry man But he was also a bunted man with the special thoughts of the fugitive.

He sank into the chair that was offered by the junior. And, while the young man was still in process of realizing the situation Alden ordered him to inform no one of his presence except Horo, chief scientist of the Covis temple.

ASTORNOING SCIENCE PICTICS

nium and Ecks are the most power-"But Horo is not here." the ful gods in the Universe. Surely."

now departed for the palace of the

Leader."

Alden began briskly to remove his female disguise. His weariness flowed from him. Not here, he was thinking gleefully. That meant he was the senior scientist in the cuple until Horo returned. For a van who lash dad as many thoughts as he had during the afternoon, that was like a reprieve. He ordered that food he brought him. He took possession of Horo's of-

lice. And he asked questions. For the first time, he learned the only reason so far made public, for the executions at the Rabeill temple. Alden pondered the reason throughout the early evening, and grew. His thinking at this time must already have been on a very radical plane, and yet, paradoxidly, he felt mortified that the gods had been so profoundly insulted in their temples.

Somehow, with a crystalline certainty—last, yet, had in it no disbelief—le know that they would not show their displeasure of their own volition. The thoughts of a fugitive tended automatically towards such practical convictions. Before the evening was half through, he was examining the possibilities.

Certain processes the gods had favored from time immemorial. Naval captains and other legal owners of spaceships brought ingots of iron to the temples. The ceremonial and money preliminaries being completed, the iron was then placed in close proximity to the uncovered

god stuff for one day exactly. After four days, one for each god, the power of the god-stuff was transmitted to the ingot. It was then removed by the offerer to his ship where, with simple ceremonials it was placed in metal chamberswhich any metal worker could make -and by the use of what was known as a pholectric cell-a device also known from the earliest times. like fire and sword and spear and

bow-an orderly series of explosions could be started or stopped at will When enough of these metal chambers were used, the largest ships that could be constructed by man were lifted as easily as if they

were made of nothingness.

From the beginning of things, the god-stuff in all temples had been kept in four separate rooms. And the oldest saving in history was that when the gods were brought too close together, they became very angry indeed.

Alden carefully weighed out a grain of each supply of god-stuff, Then he had four juniors carry a metal chamber from the testing cavern into the garden at the rear of the temple. At this point it struck him that other temples should participate in the protest. He had learned that six of the seven members of the Scientists Council were still at the palace, and

he had a rather strong suspicion as to their predicament. cilors to do exactly what he was do-

74

Writing from Horo's ornate office, he ordered the acting chiefs of the temples of the absent coun-

ing. He described his plan in detail and finished: "High noon shall be the hour of protest."

Each letter he sent by junior mes-

He had no doubts. By poon the following day be had inserted his grains of uranium, radium, plutonium and ecks into the pholectric relay system. From what he decided was a safe distance, he pressed the button that clicked over the relays in order. As the wonderful and potent ecks, the last grain. joined the "pile," there was an explosion of considerable proportions.

It was followed swiftly by three more explosions. Only two of the temples disperanded the commands of the fugitive. They were the fortunate ones. The first explosion blew half the Covis temple into dust, and left the remnant a tottering shambles of dislodged masonry and stone.

No human being was found alive in any of the four temples. Of Alden there was not even a piece of flesh or a drop of blood,

By two o'clock mobs were surging around the foot of the palace hill. The palace guard, loval to a man, held them off grimly, but retreated finally inside the gates, and the household of the Leader prepared for a siege.

When the pandemonium was at its height half an hour later. Joquin. who had been down in the city, returned by a tunnel that ran through the hill itself, and asked permission to speak to the mob.

Long and searchingly, the Lord Leader looked at him. Then finally

he nodded. The mob rushed at the gates when they opened, but spearmen held them back. Joquin pressed his way out. His was a piercing rather than a deep voice, but the rostrum that jutted out from the hill was skillfully constructed to

enable a speaker to address vast throngs through a series of megaphones. His first act was to take the rib-

bons out of his hair, and let it down around his shoulders. The crowd began to shout: "Scientist. It's a scientist."

Joquin raised his hand. And the silence he received was evidence to him at least that the riots were about to end. The crowd was con-

trollable. On his own part, he had no illusions as to the importance of this mob attacking the palace. He knew that carrier pieeon messages had been dispatched to the three legions camped outside the walls of the city. Soon, a disciplined force would be marching through the streets, paced by cavalry units made up of provincial troops, whose god was a giant mythical bird called

It was important that the crowd be dispersed before those trained killers arrived on the scene. Jo-

ouin began: "People of Linn, you have today

witnessed a telling proof of the power of the gods. Cries and groans echoed his words. Then again, silence. Jo-

quin continued: "But you have misread the meaning of the signs given us today."

Silence only this time greeted his words. He had his audience. "If the gods," he said, "disapproved of the Lord Leader, they

could just as easily have destroyed his palace as they actually did destroy four of their own temples. "It is not the Lord Leader and his actions to which the gods ob-

jected. It is that certain temple scientists have lately tried to split up the temples into four separate groups, each group to worship one

of the four gods only. "That and that alone is the rea-

son for the protest which the gods

have made today."

There were cries of, "But your temple was among those destroyed " Ioouin hesitated. He did not fancy being a martyr. He had seen two of the letters Alden had written-to the two temples which had not obeyed the instructionsand he had personally destroyed both letters. He was not sure how he ought to rationalize the fact that a purely mechanical union of godstuff had produced the explosions. But one thing at least was certain. The gods had not objected to their status of being worshiped four in one temple. And since that status was the only one that made it nossible for the scientists to remain

strong, then what had happened

could be the cods way of showing that it was their ourpose, too, foquin recognized uneasily that his reasoning was a form of sophistry. But this was no time to lose faith. He bowed his bead before the shouting, then looked up,

"Friends," he said soberly. "i confess I was among those who urged separate worship. It seemed

to me that the gods would welcome an opportunity to be worshiped

each in his own temple. I was mistaken "

He half-turned to face the palace, where far more important earwere listening than any in the crowd below. He said:

"I know that every nerson who like myself, believed the separatist heresy is now as convinced as I am that neither the four gods or their people would ever stand for such

hlasnhemy "And now, before there is any more trouble, go home, all of you."

He retreated rather hastily back into the palace grounds. The Lord Leader was a man who accepted necessities "There remains one undetermined question." he said later. "What is your real reason for keeping my daughter

Joquin said simply, "I have long wanted to see what will happen if a child of the gods is given a normal education and upbringing."

in-law's baby alive?"

That was all be said. It was enough. The Lord Leader sat with eyes closed, considering the possibilities. At last, slowly, be nodded his head.

I was to be allowed to live

THE END.

Alexander The Bait

by WILLIAM TENN

A new author presents an ingenious new idea on how to get interplanetary travel started. It's done with a Moonradar system. But not quite as the world thought—

Illustrated by Swenson

You aren't likely to get a quick punch in the smoot these days by professing admiration for Alexander Parks. Time has softened even the families of the crews who rode the GA fleet into nowhere; and uncomfortable understanding of the

great thing the man did has increased with the years.

Still, he is penalized by a hidebound agency in a manner that, to him at any rate, is especially horrible. I refer to the FLC. I hope

they read this.

We wandered into each other a couple of years after the war to end isolationism. I had just landed a Toledo accordion on a freight runway and was now headed for a bar. There are some pilots who know just how much rey they need

runway and was now headed for a bar. There are some pilots who know just how much rye they need after towing an accordion; me, I just keep pouring it down until my heart floats back into place.

heart floats back into place. A cab came up to the flight building and a well-built man with a surprisingly small head got out. As I ran up to nail the cab, the man turned and stared at me. Some-

thing familiar about that shoe-button skull made me stop.

"Were you in the Army Air Forces?" he asked.

"Yeah," I answered slowly. "The so-called Swasticker Squadron. Forty—Alex Parks! The voice with a dial!"

He grinned. "That's right, Dave. For a minute I thought you were only talking to ex-flying officers. Ground control people carry a lot of inferiority complex around with them. You're looking well."

He looked better. The clothes he was wearing lad been designed by a tailor with the salary of a movie executive. I remembered something from the newspapers. "Didn't you sell some invention or other?" "Didn't you sell some invention or other?" "I was the Radar Corporation of America. Just been cayslained. I

America. Just been capitalized. I sold them my multi-level negative beam radar."

"Get much?"

He pursed his lips and let his eyes twinkle. "Oh, a million five hundred thousand dollars."

a I flapped my lips and let my eyes to bug. "L-lotta dough. What're ed you going to do with it?"

"A couple of unholy scientific projects I've always dreamed about. I might he able to use you." He motioned to the cab. "Can we go somewhere and talk?" "I'm on my way to a bar." I told

him as the cab got under way. "Just came in with an accordion." "Accordion? Is that what you freight pilots call these glider trains?"

"Yeah. And if you want to know why, just think of what happens when you hit an sirpocket. Or a sudden head-wind. Or a motor stall." I grunted. "We make music—heavenly music."

We sat in a back booth of the Matched Penny Cafe, Alex smiling admiringly as I consumed half the amber output of a good-sized distillery. "You'd have to cut down on that guzzling if you came with me," he said.

I finished the glass, licked my steeth, my lips, and sighed. "Where?" is teeth my lips, and sighed. "Where?" is "A mesa in Nevada I've purchased. Have to have someone I can trust to the equipment in and help around the place with some moderately heavy construction. 'Someone I can trust to keep his mouth shut. A heavy drinker I keeps his open too much to suit me."

keeps his open too much to suit me."

"I'll do that." I assured him. "I'd drink nothing but curded yak milk to get out of this aerial moving van

business. Making an occasional trip will be nothing compared to my daily routine with collapsible coffins. It's the combination of monotonous grind with the angel of death that's making me bottle-

happy."

Ite nodded, "And the lack of any long-range useful goal, You flew on almost as rigid a schedule during the war, but—well, that was war. If there were something fine low which you were risking your.

life, instead of the transportation of electrical harmonicas—"
"Like interplanetary travel? That was one of your bugs. Going to do some experimenting along that

Alex slid his forefinger along the green marble table top, "I'd need much more money than that, It's a nice thought-the human race finds itself at the point today where a little research, a little refinement of existing techniques, would send it to the stars. But the people who could do it, the big manufacturing corporations, can't see enough incentive; the people who would do it, the universities and research foundations, can't see enough money. We sit on this planet like a shipwrecked sailor on a desert island who sees a pair of oars in one enot and a best in another and can't quite make up his mind to

bring the two together.

No, not interplanetary travel.

Not yet. But something along that line. That beam I discovered gave me the reputation of the world's greatest radar expert. I intend to build the largest installation ever on that mesa—and make a long-distance radar survey."

ofof I'd known. This idea, I decided,
get
showed nothing of what I'd always
thought he'd do if he had the
money to indulge his sardonically
soaring mind, his genius for sub-

soaring mind, his genius for subtlety. "A radar survey?" I asked weakly.

His little head grew wide with

His little lead grew wide with laughter, "A map, my dear Dave —a topographical map of the Moon!"

Nevada was nice. Plenty of handing space. Plenty of working space. Practically no one to ask questions. Sharp, fragrant air on the top of Big Bluff Meas that affected me almost as strongly as booch used to. Alex claimed atmospheric conditions here were perfect for maximum equipment

The equipment was odd. Of course, I knew radar had developed genormously since the days of primitive gadgetry in the early forties. Parks' own MLN Beam had successfully fused communication radio into a featurable seven that required no transmitter and made it possible to tune in on any outdoor event in the dworld. (It was still in production then.)

efficiency.

Alex and I got the shacks built ourselves, but we ran into trouble with the huge horizontal antenna and the gyroscopically stabilized dipoles. In the end the hird a mon named judson from Las Vegaa, judson did odd jobs around the place and supplied an extra pair of lands in construction jobs, Mrs. Judson cooked our meals. Alex admitted the necessity for Judson, but seemed to regret it nonetheless. I suspected he sent me on sleeveless errands now and then, as if to keep me from having a coherent knowledge of his methods. I shrugged at that thought. If he thought I knew enough about modern radar,

knew enough about modern radar, I was highly complimented. When I flew in with a rattling glider train of impossible coils and

surrealist tubes, he often insisted I stay put while he made some infinitesimal adjustment in the lab shack. I could climb out of the plane, then, but only if I went directly to the but which was our living quarters.

Emmanuel Corlis, of the Radie Copporation of America, begged a ride from me once. All the way to Nevada be sang Alex's penises; be told me of the statue of Alex in the foyer of the corporation's skyaction of the comporation's skyaction of the composation's skyaction of the composation's skyaction of the composation's skyaction of the composation's skyaction of the composation of the radie of the composation of the Father of Global Communication." He said be wanted Alex to come back as chief research consultant, laying his second enjoy have the playing his second enjoy have the laying his second enjoy have the composation of the playing his second enjoy have the composation of the composation of the laying his second enjoy have the composation of the composation of the laying his second enjoy have the composation of the composation of the laying his second enjoy have the composation of the composation of the laying his second enjoy have the composation of t

I was wrong. Fifty miles from Big Bluff, a deep voice rattled the reception

panel. "Who's that you're talking to, Dave?"

Corliss piped up. "Thought I'd look in on you, boy. We might be able to use whateve: you're working on now."

53

"Well, you can't. The moment

ex ad- and fly Mr. Corliss back to the nearidson, est airport. Got enough fuel?"

"Yep." I was embarrassed. Felt

like a neighbor overhearing a newlywed couple's first quarrel.

"But, Parks," the executive wailed, "you don't know what an important figure you've become.

The world wants to know what you're doing. Radar Corporation of America wants to know what

of America wants to know what you're doing,"

Parks chuckled. "Not just yet. Don't get out of that plane, Corliss.

or you'll get a load of buckshot in the most sensitive part of your upholstery. Remember, I can call you a trespasser."

Corliss sputtered angrily. "Now you listen to me..."
"No, you listen to me... Don't

n get out of that plane as you love your swivel chair. Believe it or d not, old man, I'm doing you a favor."

That was sort of that. After I'd deposited the red-faced corporation president, I bumped down to the mesa pretty thoughtfully. Alex was waiting for me; he looked thoughtful, too.

"Don't do that again," he told me. "Nobody comes out here until I'm ready for, well, for publication. I don't want strangers, especially scientific strangers, poking around in my layout."

"Afraid they'd copy it?"
My question tickled bim. "That's
it . . . almost too exactly"

"Afraid I'll copy it?"
He threw a quick, shread glance

some talking, Dave," He put his arm around my shoulders.

While Mrs. Judson dealt out the plain food very plainly prepared, Alex studied me in the hard unwinking fashion he had. I thought again that he resembled nothing more than a ministure camera ser on a massive, unwieldy tripod. Grease-stained blue jeans had long ago replaced the soft sartorial perfections in which I'd first seen him. The father of global communica-

tion! He looked covertly at Judson, saw that the hired man was interested in nothing but his stew, and said in a low voice; "If you feel I distrust you, Dave, I'm sorry. There is a good reason for all this

secrecy, believe me." "That's your business," I told him shortly, "You don't pay me for asking questions. But I honestly wouldn't know an oscillator screen

from an indicator rack. And if I did, I wouldn't tell anyone."

He shifted on the hard wooden bench and leaned against the metal wall behind him. "You know what I'm trying to do. I send a highfrequency beam at the Moon. Some of it is absorbed in the ionosphere. most of it gets through and bounces off the Moon's surface. I catch the reflection, amplify it, record the strength and minutest change in direction on a photographic plate and send another, slightly different, beam out immediately. On the basis of multiple beams. I build up a fairly detailed and accurate picture of the Moon from very close

range. My multilevel-negative radar provides a somewhat stronger beam than science has had at its disposal before, but essentially the principle is basic radar. It could have been done, with a little difficulty, ten years ago. Why wasn't it?"

Stew congealed into an unsavory jelly in my plate. I was interested

in spite of myself. "It wasn't done," he continued, "for the same reason we don't have interplanetary travel, suboceanic mining, grafting of complete limbs from coroses on amoutation cases. Nobody can see any profit in it, any immediate, certain profit. Therefore, the small amount of research that is necessary to close the gap between the knowledge we already have and the knowledge we almost have goes unfinanced?

"But work goes on in those fields," I pointed out. "Work goes on, all right. But at what a slow pace, under what hearthreaking conditions! Have you ever heard the legend of how my namesake, Alexander the Great, circled the world astride a giant bird? He hung a piece of meat from a long pole and dangled it in front of the bird's beak. A strong gust of wind blew the meat close enough for the creature to snatch. and the redoubtable Alexander immediately cut a piece of flesh from his side and attached it to the pole. Thus, he was able to complete his trip with the bird futilely trying to reach the meat by increasing its speed.

"The story occurs in several folklores with different beroes, but it shows how fundamental was the ancients' understanding of humorities. Incidentally, it is also a beautiful illustration of the laws of compensation. In every age, a man must offer himself up as bait so that progress will not be limited to the back pages of the dictionary. We can't be said to be moving forward if we touch none of our never po-

if we touch none of our newer potentialities."

I stirred the stew with a heavy spoon, then pushed it away and reached for the coffee. "I see what

you mean. But why tell me all this?"

Alex rose, stretched and moved towards the door. I smiled apologetically at my coffee and birs, Judson and followed him.

The cool Newada right bung heavily as we walked outside. A myriad stars blazed pinpoint mysteries. Was this black, inviting space man's natural medium, a domain waiting for the flashing troad of a master? Could it be that my pury species was the appointed ruler of these vastnesses? I wondered how it would feel to bank deep the country of the country

"These are the maps I've made to date," my employer observed. We were standing in the lab shack with banked transformers, nightmares in spun glass and twisted wire weaving in and out of the huge display tubes around us.

I glanced carelessly at the maps; I was no astronomer. Then I

the glanced very carefully indeed at the

The point is they weren't maps. They were pictures—over a thousand aerial photographs—taken from a uniform height of about five hundred feet. They had sharper detail than any aerial photographs I've ever seen. You could count the rocks on the surface; you could

note pits and the narrowest fissures.
"They are pretty good," Alex said. He stroked one of the glossy

sheets lovingly. "A section of the Tycho Brahë Crater." "Why the Samuel Aloysius Hill

don't you publish?"
"Couldn't ill now." He seemed
to be in the throes of a hard decision. "I had to check something
first. And now I've got to trust
you with my life's work by adding
you to play a particularly dirty rick
on yourself. I still can't afford to
explain; my conversation tonight
was sort of a song and dance to go

with the request. But some day it will all fit."
"Go ahead. I'm a loyal employee; I love the firm."

The pinhead seemed to swell.

"One week from today I want you to take a trip up to the Canadian North Woods with a couple of packages. You'll have a map with X's scattered over it; the co-ordinates of each X will be marked in the margin. Latitude and longitude in

of each X will be marked in the margin. Latitude and longitude in terms of degrees, minutes and secourls. Bury each package about two feet underground at X-designated spots, making certain that it is at the exact intersecting point of the co-ordinates. Then go away."

co-ordinates. Then go away."

"Hub?"

"Go away and forget you ever saw those packages. Don't even dream about them. Don't see me except socially for at least three years. Forget you ever worked for me. You can keep the plane and I'll add a sizable check as a parting gift. Will you do it?"

I let my mind chew on it for a while. It didn't make sense, but I knew he'd told me all he intended to. "O.K., Alex, I'll take the high road and I'll take the dough road.

I'll make out." He seemed tremendously relieved.

"You will make out-much better than you think. Just wait a few months. When the united savants of the world start flocking in here. there will be lectures and juicy magazine articles thrown at anyone who ever worked for me. Don't touch them with a transmitting antenna."

That made me laugh. "I wouldn't anyway. I don't play those games."

Alex shut off the light and we returned to the Judsons feeling pretty good about each other. That was the way a sweet guy called Alexander Parks climbed up on the altar of history. When I think of the fundamental ambition that drove him to that conversation, the action of the FLC seems cruel on a scale immeasurably picayune.

the north woods laying little tarp covered eyes here and there by means of a chart so explicit as to be understandable by the littlest moron

in one of his most difficult momente

Newspapers caught my eye when I landed in Seattle. Full frontpage spreads of the pictures Alex had showed me smaller shots of Alex's small head surrounded by hig-browed, white-maned profs from Oxford, Irkutsk and points

east "Radar Genius Maps Moon," they screamed. "Sage of Nevada reveals work of two years. Scientists flock to mesa, claim telescopes now obsolete except as check. Alexander Parks announces he will make mineralogical survey of lunar sur-

face."

So he had announced it. Good. I spent a portion of my last pay check investigating any new developments in the gentle art of making whiskey. The liquor, I found, hadn't changed; unfortunately, I had. Laboring under a diminished capacity, I gamboled from binge to hangover, from bar to hotel room,

until I woke up in a hospital surrounded by a straitiacket. After the doctor had chased the six-headed snakes away, I sat up and chirruped at the nurses. One luscious little redhead took to read-

ing me the newspapers in a pathetic attempt at self-defense. I was gettion the news in jerky flashes, what with her dodeing around night tables and behind screens, when I heard something that made me reach A week later I was flitting about out and grab the newspaper. The girl, who had been preparing for a last, all-out effort, looked a little dared I still have a hazy memory of

that nurse standing in a corner and chaking her head while I got clearance. The doc didn't feel I was cured yet at all, but he decided that as long as I wasn't talking too loudly about ring-talled octop it would be just as well for his lypo house if I took up residence elsewhere.

Barcomb Rockets were the nearest and I was there a half hour after a startly clerk had given me my clothes, money and a little white certificate, suitable for framing. I'd gone through every newspaper in reach by the time I arrived; so I was prepared for what I saw.

A two-by-titree experimental bouse which had been operating on a frayed shoestring of a budget was expanding like a galaxy turned supernova. Far off into the distance, I could see shops and haugars going up, stock piles being built, could mean arriving by the cubic ton.

equipment arriving by the cubic ton.
Tim Bascomb was checking blueprints in front of the half-finished
Parthenon that was to be the company's main building. If met him
at an ex-pilots' convention a year
after the war, but I thought I might
as well reintroduce myself—some

as well reintroduce myself—some insensitive people manage to forget me.

The moment he heard my voice, he dropped the blurgints and

grabbed my hand. "Dave! You haven't signed any contracts yet?" he finished anxiously.
"Nary a clause." I told him "Can

you use a*former B-29er and accordion player?"
"Can we use you? Mr. Hennes-

sey-Mr. Hennessey, get me con-

tractual form 16, no, better make that 18. You were in on the early as jet and rocket jobs," he explained. "That puts you into an advanced

category."
"Hiring a lot of the boys?"
"Are we? Every backyard gad-

"Are we? Every backyard gadgeteer in the country is forming a corporation these days and we're keeping up with the best of them. They say the airlines are using hostcases as co-plots and canby butchers as radiomen. You'll find Stev Yancy and Lou Brock of the Canada-Mexico Line in that shack, over there; they'd like to see you."

Mr. Hennessey and a stenographer served as witnesses. I started scribbling my name on that contract as soon as I saw the numbers after the dollar sign under "salary."

- Bascomb laughed, s "I'll back our payroll against

any in the world. Not that at least fifty other companies don't do as well. We've got the backing of Radioactive Metals and the Ginnette Mining Corporation as well as a government subsidy of five million."

I wired some blue-black int off

my fingers. "Since when is the government interested?" He chuckled. "Since when?" We began walking to a huge structure labeled "Bascomb Rockets

Experimental Pilots—No Admittance to Unauthorized Personnel."

"Look, Dave boy, when Parks took
those radar snapshots of the Moon,
the astronomers were interested.
When he worked out a spectroscopic table and found there were
healthy hunks of godl under the surface, the banks and mines began to sit up. But when that Caltech prof turned Parks' ginunick along eighty miles of the Moon's Aloine valley and found alternate layers of radium and uranium, the nations of this planet looked up from atom bomb experiments long enough to harness everybody who knows the Moon is a quarter of a million miles from Earth. It's no longer a matter of the first sytraterrestrial explorer becoming a trillionaire overnight, but of folks cooking stom hombs in their kitchens"

I looked at the tractors backing and filling around me; at the cement-sloppy wheelbarrows being trundled by an army of construction workers; at the bare useffolding of shops rining on every bare food of ground. This scene was expensively being the probably in every nation. Slap some nort of a sing together, solve the problems with any kind of jerry-built apparatus—but get to the Moon first!

but get to the Moon first!
"It sin't only a matter of national
defense, either," Tim was explaining. "We almost have atomic
power, in fact, we already have it
but not in a commercial form
to the single single single single single
deregard out of the Moon, the old
Standy Supplement dream of
crossing the Atlantic with a teaspondial of sand for field will

be- Tycho, but they sure will bust a

He led me into the pilots' shack where a lecture on astrogation was in progress. And that day the only rockets on the Bascomb lot were still on drawing boards!

"The Mad Scramble"—int that the name of the definitive intery of the period? It was mad. People still remember the first casualties to hit the front pages: Gunnar and Thongressen getting blown to bits a half-mile up; those six Russian selentitis fluming into an incandescence that registered on every astronomical customer pointed at the Moon. Then that would be selected the selection of the sele

Even then, Steve Yaney and his kid brother got knocked off on a simple experimental flight outside Earth's atmosphere. No fundamental principle overlooked, we were just building carelessly.

wildest experimenters.

"My no Transmig Medicatopped in on use in his way from the Leony Propulsion Project, we seemed to be gitting nowhere fast. That was the Black April, the month of the GA Fleet. Baccomb had discovered I knew Parks personally and begged me to bring him into the firm. "He's just hopping about giving advice to anyone who wants it from him. With his reputation, if he ever went to work for one organization he could name this own price. Try to get him to

"I'll try," I promised. "Of course, I know his basic interest is in radar research. If his machine had stooped with mapping the Moon, every hick college would probably have had an appropriation for a radar telescope or whatever they call it. But since he found uranium in them than craters, kids are being jerked into research projects as fast as they finish elementary physics. That guy from Caltech-what must his name?--who first detected radioactive stuff with Parks' equipment. they say he has to go up to the mesa every time he wants to survev some more moon. He can't get the university even varuely

interested in building a toy for

him, and Alex P. won't let any-

one near the layout unless he's on

the scene holding their leash." "Yeah." I grinned wryly, remembering the way Emmanuel Corliss had been sent back to his dictaphone. Even when some scientific journals had attacked the tight control he maintained over the world's only lunarsurveying radar, he had retorted angrily that the entire apparatus had been developed and built out of his own brain, time and funds and if anyone didn't like it they could build themselves another. Of course, with every research penny eventually finding its way into spaceship design, he had the only game in town.

Parks laughed when I gave him Bascomb's message. He clambered out of the new-smelling, black and

silver job that I was to take on a ic shakedown in a week and sat on If the curving metal runway.

the curving metal runway.

"No, Dave, I like this being advisory expect to big business in rocket research. I get to travel and see all the different things we're trying. Did you know Garfinkel of Illinois is working on a Cosmoplane-sort of a sailboot sensitive to cosmic rays? I'd rather not get atuck in a jod in one corner of this business. After all, arwone may hit it."

"But that lien't like you, Aley," I argued. "You were always the kind of guy who wanted to do things himself. This work int' right up your alley, it is your alley, You're the one man Bascomb Rockets needs, not as a gart-time unguid specialist wob hirt us one a month on his look-sec circuit, but as the director, the co-ordinator is a the director, the co-ordinator with a projection of the contract of the contrac

gether?"
"No." I sighed. He evidently
didn't want in. I helped him
change the subject. "Nasty-this

GA business."

He was staring at the ground.

He nodded slowly, then looked up.

There were ridges of anguish on
his face. "That was Corliss," he
said in a low, carnest voice. "He
became president of General
Atomics six menths ago. The

idea of the Fleet probably seemed like a good publicity trick."

I disagreed with him. "After all," I pointed out, "the logic was good. Ten ships setting off for the Moon together. When one of them bit a snag, the others could come up and help. In case of an the threatened ship could be transferred to safety. It was just plain unfortunate that Fouquelles didn't discover the deep space Jura rays until a week after they left. From now on everything we build will be insulated against the

"Five hundred meu," Alex brooded. "Five hundred men and women lost without a trace. Nothing in the papers today about a radio signal, about some debris coming down somewhere?"

"No. They probably got out of control and drifted into the sun. Or maybe the ships—those that are left—are scudding aimlessly out of the system."

He was himself again when I left him at the gate. "Maybe I'll have cracked it the next time I see you," I said. "We're moving pretty slowly, though."

"That doesn't mean anything." He shook my hand warmly. "Man has his heart set on getting off this planet. He'll do it—perhaps sooner than he thinks."

Two months later, Captain UIrich Gall landed the Canadian Flutteer II in Plato Crater, using the double-flow drive. It's highschool history now how Gall lined his spacesuited crew behind him and prepared to move through the form lock. How he causely his foot ou the ramp, and how his polynesian "boy," Charles Wau-Neil, hurrying to extricate him, tripped on the lock and shot out onto the hunar surface—thus being the first human to touch another world. I was co-pilot of the fifth ship to reach the Moon—"The Ambas-

to reach the Moon—"The Ambassador of Albuquerque." I was also the first man to set insulated foot on the lunar Apennines. So I'll bave a place in some sixvolume detailed history of lunar exploration: "An interesting discovery is credited to a minor

well, you know what happened.
Toehold, the colony Gall left on
the Moon, continued the feverish
examination of mineralogical sam-

ples. No go. In six months Toehold scientists radioed a complete confirmation of Gall's early suspicions.

There was no uranium on the Moon. No radium. And there

was just enough gold to be detectable in the most deficate analyze.

Of course they did find some nice beds of iron ore. And someone discovered rocks beneath the surface from which oxygen and the lighter elements could be extracted with case, making possible Toe-bold's oresent indigenouspees. But

to uranium I was on Earth when the storm of public opinion broke. Financed g and encouraged by hysterical corporations, it broke first around dt he head of a certain California professor of astronomy and buried be him. He, it was, who had first an nounced the presence of radio-

active minerals on the Moon as a result of experiments with Parks' radar. Then it turned on Parks.

Remember the headlines that day? "Parks Admits Fraud" in letters as big as the end of the world. "Alexander Parks, Nevada charlatan, explained to the FBI today how he planted transmitters near pitchblende and gold deposits in Canada, co-ordinating his infernal machine with them to make it appear that the impulses were arriving from a given portion of the Moon. 'I never allowed anyone to investigate the machine too closely,' Parks lecred, 'and this, with my international reputation as a radar expert, prevented dis-

as a faaar expert, prevented discovery."

I scotted for his meas. There were state police coming out of the woodwork, FBI men being transpeld underfoot and what looked like a full infantry regiment marching back and forth. After I'd satisfied everybody that I was a reputable citizen, I was allowed to see Alex. He was evidently a

de facto prisoner.

Alex was aiting at the plain table, his hands chapped essily in front of him. He turned and front of him. He turned and and the state of the

him why. Ask him why he did it,

"I've told you that at least a dozen times," Parks said mildly. "There was nothing against you personally, nothing against anybody. I simply felt it was time we had interplanetary travel and that greed was a good incentive. I was

"Right!" Corliss screeched.
"Right! Do you call it right to
fimfiam me out of three million
dollars? I personally invested
three million dollars to get what?

Iron ore? If I want iron ore, isn't what we have on this planet good enough?"
"Your consolation, Mr. Corliss, in your financial berrovement, is

that you have helped humanity to take a major historical step. You will recall that I went as far as using a shotgun in an attempt to keep you from getting involved in my . . my plans. Beyond suggesting that you record it in your income tax under bad investments. I'm afraid I can't help

a you."

"Well, I can help you!" The
more resident of General Atomics and
the Radar Corporation of America
d shook a pudgy, quivering finger
under Park's nose. "I can help
you into jail. I'll spend the rest
of my life trying!" He slammed
the door behind him so hard that
the slake secred to move three

feet.
"Can he do anything, Alex?" I
asked.

He shrugged. The pinhead looked tired. I suspected there had been a lot of this lately. "Not so far as I know. All the development on my lunar radar was out of on my own inude. While I gave advice freely to those who wanted with the man and the same of the contraction of the contraction of the conbenefited in no material way from the fraud. My lawyers tell me it may be a tight squeeze, but there isn't applying that can be done in the way of punishment. In in the the way of punishment. In in the the way of a punishment. In in the and the contraction of the

"No!" I put my hand on his shoulder. "You've made life worth living for hundreds of us. Listen, Alex," I said softly, "I don't know what history will say, but there are a lot of sky-jockeys who will never forret you."

He grinned up. "Thanks pal. I did try to keep you out of the mess. Name a precipice after

me."
We can't go any further than
the Moon right now, but I have a

dandy little two-man ferrying job —secondhand of course—and as soon as I can scroninge up enough cash, I'm going to fit it with that new triple-flow drive. They say geological stage, and that means a lot of whole radium and uranium will be lying about. The first man to get there and stake out a claim would be kinda well-to-do the res of his fife. Yeah, that talk may just think; if it so —

Whatever its original impulses, interplanetary transportation is here to stay. But what of the man responsible?

The Federal Lunar Commission (FLC) has issued a permanent injunction to all its offices against granting Alexander Park terrestrial clearance. And unless he stows away on some supply shor or time beals that particular wound, I'm afraid be'll be a wistful Earthlubber to his dwing day.

THE END.

THE ANALYTICAL LABORATORY

The Lab is definitely thin this month. The February Assumding, because of a concatenation of circumstances, contained only three pieces of fiction, and with the volt-points ranging only from 1 through 3, all the point scores were bound to be close toochier.

At any rate, the scores came out this way:

Pla

	Author	Points
Special Knowledge	A. Bertram Chareller	1.72
Fairy Chessmen (II)	Leuis Padgett	1.83
This Is The House	Lawrence O'Donnell	2.72
	Fairy Chessmen (II)	Special Knowledge A. Bertram Charoller Fairy Chessmen (II) Lewis Padgett

THE Entree.

Brass Tacks

Angelenos Please Note!

Dear Mr. Campbell:
You and your reder's will no
doubt be interested to learn that
A. E. Van Vogt, the author who
has risen to scientifictional heights
under your aegis, has been selected
as honor guest for the 4th WORLD
SCHENCE-FICTON CONVENTION. This is the second time
that one of the authors developed
by Asteudnigh lass been picked for
speaker, Robert Heinden having
had this distinction at the last
Convention, hold preser at Den-

ver.

The 4th World Science-Fiction
Convention, first full-scale meeting
of science-fictioneers since 1941,
will be held in Los Augeles on
Lute 4.5.6.

The Convention will be popularly referred to as "The Pacificon."

Memberships—one dollar—in the Pacificon Society are immediately acceptable by Chairman Walter J. Daugherty, 1305 W. Ingraham, Los Angeles 15, California. Join now to receive all literature pertaining to the event. Plan to attend! —Forrest J. Ackerman, Pacificon Publicies:

Dear Mr. Campbell:

Attendees at the Pacificon—the VORLD SCIENCE-FICTION CONVENTION—in addition to hearing A. F. Van Vogt speak will have the opportunity to meet and talk with such popular writers as Padgett, Rocklyme, Hubbard, C. I. Moore, E. Mayne Hull, Cartmill

and Laurence O'Donnell.

July 4-5-6-7 is the date; Los
Angeles, the city. Membershipsone dollar—in the Pacificon Society
should be sent to Walter J. Daugh-

erty, 1305 W. Ingraham, Los Angeles 15, Cal. Readers in the metropolitan area

are especially urged to contact the Convention Committee—Forrest J. Ackerman, Pacificon Publicist. Well, Man's the laciest critter on Earth, and if he can get a little atom to do bia work, he'll have more time to set and think how to get out of doing what work is left to do.

amerome

Dear Mr. Campbell: Grandpa Sneejum, being a little low on book-learnin' likes to have me read to him from Astounding. He particularly enjoys hearing the technical tales of George O. Smith -like "Trouble Times Two" in the December issue. The words, he says, sound so mysterious and

from way back, is equally awed by the atomic saga and the snappy little excerpts from Dr. Smyth's report. He onines that the whole project was right smart, and that atomics might eventually effect the biggest change in civilization since the disappearance of the celluloid collar He has just one question, though,

Grandos Specium, though a fan

And that after hearing my summary of the editorial and Brass Tack comment, with its general enthusiusm over the tremendous progress forward of humanity via atomic energy-and its specific zest over things like Astounding's on the Moon by 1955.

The query is kinda flabbergasting. Grandna wants to know solor an

atomic civilization would mean progress for mankind,-Bill Stoy, 140-92 Buyden Crescent, Jamaica 2. New York.

Dear John:

For the other John Campbell's benefit, ASF, XXXVI, ii, 147, "Sprague" rlivings with "plague" and "de Camp" is pronounced the same as "decamp," "Willy Ley" is "willy lay," not "veely lie." His surname was pronounced "lie" in German, but he switched to "lay" in this country because of the unfortunate homophony of the original. And "willy" is close enough to Willy's German, wherein "w" spells a bilabial voiced fricative, like the intervocal "b" in Spanish, between English "w" and "v." Asimov is AZ-im-off; Heinlein HINE-line: del Rey del-RAY, and

his real given name is Ramon fol-

lowed by about a dozen more

Spanish names. I could do this much better if S & S would invest in a set of International Phonetic type.-- L. Sprague de Camp.

The Gentleman has a point!

Dear Mr. Campbell:

I have just finished "The Fairy Chessmen." The theme and plot were superior and the language was outstandingly pleasing. "Chessmen" compares very well with the best fiction being written anywhere today. Mr. Padgett has mastered fine English as well as

technology. Billy Van Ness' extratemnoral perception brought to mind a flaw in the theory of time travel. Time travel is an old and proven medium for expressing all sorts of complex

situations. It is readable; it is respectable. In 1944 Astonding published a fine story called "As Never Was." It is a detailed and logical textbook of time-travel theory, and goes to show how much carnest thought has been given it. The flaw seems to be this; in

perceiving the duration of things Billy Van Ness experienced their temporal motion, but not the accompanying spatial motion. In a laboratory. Billy walked around equipment that would be there in the near future; he felt the long duration of the Duds and of Ridgeley. This assumes that time has for its inflexible center lines come fixed spot: in this instance, whereever Billy's sensitive mind hanpened to be. Actually, Billy would have seen these things trailing away behind and before the Earth's point in its orbit as it swung out of the temporal positions of the past toward those of the future, and also out of the points

it had previously occupied in space toward new points. Billy's world would move in time, and through space along the Earth's orbit corrected for rotation, perturbation and various sways and wobbles. Complex as this would be, these are the only factors if the center of our system were also the center of our time. but this is not so. Sol has a definite but duly charted truck around the nucleus of the Galaxy. And what monstrous swoops the nucleus makes have not been imagined. Billy would perceive the worlds of the past and future along a complex and immense track, the time machine and its variations selects some point in Billy's world and moves to it through a measurable, reliable time; but a measurable time, but a measurable time, and the a measurable time, and

The most direct solution would be to find the "center" of time and then determine the exact motions of all things about it. Somewhere the Earth would again occupy the same space as it does now; it would be an easy move through time alone to this point.

In a universe of enormous motion, as ours seems to be, there is slittle chance of success with this method. The next best answer is so load the time machine on a spaceship, seek some point remote from spatial motion, then move the slip in time and take your chances. The Earth might then be sought by reverement in searce alone. Tedius,

but fun Don Scott Arlana

Mich.

Hm-m-m-but there is an acute psychological difference between contemplation of the concept of death and contemplation of your own immediate and violent destruction! Many a man who where death philosophicalls, its

the abstract becomes frantic when he sees his own death abbroach.

Dear John: No doubt Brass Tacks will have plenty to say about "The Fairy Chessmen." Unlike "World of A," it will probably not be extolled by many as a landmark of sciencyfiction. At least, such is my oness. But I think some readers will assert that in the story Padgett has introduced a new concept; to wit.

his variable-truths equation. Well, I'd like to anticipate this reader-reaction, should it occur, and not myself on record as differing from it. Unless I misread passages of considerable length in the story-Padgett has not introduced a new concept. And to solve an "equation" which denied the "fundamental truths" of science would not require mathematicians who wrote fairy tales, or mathematicians who played fairy chess, but just mathematicians.

Now first of all, it's obvious from the story itself that Padgett is not one of the math men himself. (Witness the peculiar insistence on the importance of the "speed" of a falling body; the most nonmathematical engineer knows that it's the acceleration and not the speed which is roughly constant in the Earth's gravitational speed.) It's also obvious from the many excellent stories Padgett has contributed in the past that knowledge of math is anything but essential to the writing of first-rate science-fiction. However, it is painfully obvious that Padgett should have acquainted himself. not with the details, but with the principles, of mathematics, before writing "The Fairy Chessmen." Had he done so, he would either have realized that he just didn't lsave a new concept, or he would have stated the hypothetical new concept in a manner less liable to misinterpretation. If you'll hold

on a minute I'll try to explain what I mean by these harsh-sounding

statements of mine. Roughly, the main problem throughout most of the story is the impossibility of finding anyone with a scientific background who has a sufficiently elastic imagination to accept, and work with, anything which denies familiar concents. I quote from the first installment (p 44): "The average scientifically trained mind is inelastic by definition; it's fan-shaped. It's imaginative at the wide part of the fan, but it's rigidly censored by the narrow part-the accepted basics." Very well-expressed, and very true, of the average scientifically trained mind, in fact of most scientists and applied mathematicians. But one of the most important features of pure mathematics is its insistent refusal to accent any basics at all

Here's the way mathematicians attacked the uply fallacy that two plus two equals four. They looked at the old familiar integers that had been man's counting tools since prehistoric times, and demanded "What are the essentials in this thing? How can we state simply the arbitrary properties which have been assigned to these symbols '1, 2, 3-'? What are the properties of numbers which make them behave as they do and which have made them so useful?" After sufficient thought had been expended on these questions, the point was reached where one could catch hold of the basics pretty well. One could say, "I'm going to write down a symbol for zero, a symbol for integer-any integer at all-and a symbol for add. I'm not going to say what they mean, Next I'm going to assume certain properties and require my symbols always to have these properties. Now I'm ready to define a new symbol, '1,'; then '2', then '3', then '4'. Having done this I am prepared to prove that if my basic symbols have the assigned properties and if my defined symbols accord with my definition, then-two

actly what Giuseppe Peano does in his Arithmétique The next sten in the mathematician's procedure is the crucial one and the one which I think makes my point against Padgett. The math men are not content to sit back and say, "Look, I have shown the essential features of our system of integers," Instead they get a little impatient and say, "If the properties we have assigned our symbols lead to the familiar intepers and to the theorem '2 plus 2 makes 4', what would happen if we assigned different properties?"

plus two equals four." (In case

anyone's interested, the above-

sketched procedure is almost ex-

That question represents the natural next step in the mathematical thought-process. If one set of assumptions—i. e., basics—leads or interesting and familiar results, perhaps a modified set of assumpposts will yield results equally interesting and less familiar; let's try. And the mathematician

does.

I don't care whether he writes
fairy stories, I don't care whether
he plays fairy chess; he's strictly
in the habit of assuming nothing

Perhaps I should append to the above these two disclaimers. I am not trying to represent the muthematician as superior to other scientists, but merely to point out the difference in approach; so all you physicists and engineers can lay down your hatchest and premy scalp for another day, your tornahawle also. I am decidedly not trying to run your story down. I enjoyed it very much in spite of my mild rebellion at the feature mentioned above.

To me, the best thing about "The Fairy Chesmen," outside of its as great value purely as a story, was the point made in the closing pages at the second installment. Conanticipation of, war, may at times a seem necessary, but is likely to lead to an acceptance of war by the propole as a natural and inevitable biling, which in turn creates a state 2 of mind highly conductive to furcited war's accountly breaking out. something the man of today doesn't like to contemplate. Nevertheless, the possibility of Ridgeley, like the possibility of an atomic war, something we must force ourselves to contemplate no matter how unpleasant the process may be; all praise to Mr. Padgett for working it into his story.

it into his story.

Now for a few comments on the
two issues in which Padgett's serial

ran. January 1946: 1. "The Fairy Chessmen."

"The Fairy Cl
 "The Plants."

3. "N Day."
4. "Veiled Island."

5. "A Matter of Length."
6. "Fine Feathers."

In this issue, I was much amused by the "pterodactyl" depicted by the artist as a Chinese dragon with a segmented body and bird's wings, apparently breathing fire: (P 71.) In re "Fine Feathers," I remark only that Smith is as unit to write of Van Vogt's Galactic Ones as Van Veet is to wite of betarnowing the

February 1946:

"The Fairy Chessmen."
 "This Is the House."

3. "Special Knowledge."

"This Is the House" is pleasantly reminiscent of Padgett's beautiful little shorts of many months back —"Shock," "Ghost," and the rest. Same writing style, same slow build-up, same agonizing feeling of unrelieved suspense at the end. "Special Knowledge" suffered from insilizations of corn which the autor could certainly have avoided. Hm-m-m, let's see. What round the weather tend to be like on Venus if, as Chandler guesses, it rotates much more slowly than Earth? Coriolis force would be less, correct. The other min actors influencing cyclones and anticyclones are independent of speed of rotation of the planet centrifugal force tending to drive air away gal force tending to drive air away

from a high or a low, and pressure gradient pushing air from high to low. But centrifugal force depends on speed of rotation of the air mass, which in turn depends on Coriolis force-quotick, Williamor Coriolis force-quotick, Williamfirst guess is that a lower august volocity of air mass would case cyclones to cover almost as large an area as unit-cyclones, instead of the latter's being much more sprend out, as on Earth. "Tis only

In ending this already overlong letter, I want to complisment Automatings a cultorial policy on the atomic bomb. Not that I agree with excepthing that's been said but if anything's needed one it is something to joil people into a realization of the terrible danger that confronts them so immediately. Automating is supplying glettery of joils, with its honest and explicit competers—In Campbe, December 1997, and the confidence of the confidenc

Industrial machinery is usually dull in color, a jumille of strangely shaped masses, of interest only to the technician. But sometimes a photographer with imagination afind in it strikingly effective pictures. Westinghouse Electric Company doesn't ordinarily name their photographer—but the gentleman is good. The shot of a work-man soldering armature winding leads onto the collector rings of a big rotary converter is a dramatically lighted pattern shot. The insulator bushings of—and far conoved from the all-too-familiar full-face, flat-lighted catalogue shot that makes a 100,000 kilovatt power insulation look like a child's model.

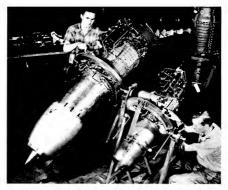

Westinghouse has a crystal-gazer, too—ouls this crystal predicts some highly interesting decorative lighting effects. The globe represents the simplest light-source imaginable—it consists of practically nothing in a glass hubble. The light comes from highly ionized gas, under very low pressure; the energy, however, comes from the high-frequency electric field produced by the darkly shadowed metal disks at the upper right. The light can be made the orange-red of neen, through the entire spectrum right. The light can be made the orange-red of neen, through the entire spectrum of colors is possible in this system than in the familiar neon tubes; oxygen cannot be used in standard tubes because it is so currosse when electrically activated.

Above is the exhaust orifice of one of Westinghouse's jet motors. designed for the Navy. Both General Electric and Westinghouse have worked up jet motors, but the two types differ much as the gasoline engine and Diesel engine-both internal combustion piston engines-differ in the way they apply the same general principle. Westinghouse uses an "axial flow" type compressor, followed by the combustion chamber and the turbine which powers the compressor. The original Whittle British engine, like GE's jet, uses a centrifugal compressor, in which the air enters at the center, is accelerated outward by paddlelike blades, and leaves the compressor at right angles to its direction of motion on entry. To enter the next stage of the compressor, it must be redirected toward the center, and is then compressed outward again.

The "axial flow compressor" is simply a turbine working in reverse; the air enters at the front, travels in a straight line through the compressor, and leaves at the rear. In the drawing on the top of page 104 is an artist's cutaway view; at the right, the air enters the intake throat, passes to the compressor at the center; goes through the combustion chamber just to the left, then on to drive the turbine at the laft. The compressor is a multiple-stage turbine in effect, with

alternate rows of stationary and moving blades, very carefully and accurately shaped. When the plane using such a motor is stationary on the field, air enters the intake throat at about 300 miles an hour. The compressor blades are small—the overall diameter of this. the "large" size engine, is only 19 inches-but turn at terrific speed-18,000 R.P.M. After mixing with the fuel and burning in the combustion chamber, the gases, now much expanded by the heating, must leave at the rear through an orifice of the same approximate size as that through which they entered. Since the volume has increased, the speed at exit must be higher. The net acceleration between speed-atinput and speed-at-outflow has been caused by the force of the compressor; the force has its equal and opposite resultant on the compressor which drives the jet-motor forward.

Rating the power of a jet motor is difficult because its output is pure thrus; when the jet engine stands still, it does no work and technically its horsepower is zero. On the other hand, at 600 MPH the 19-linch jet motor delivers a thrust of 1,400 pounds—and that's horsepower!

The compressor is driven by the power developed by the small turbine; that turbine may be small, but in this 19-inch model, it develops 3,400 horsepower!

On the bottom of page 104 is a picture of a modified jet engine, the gas-turbine engine. Essentially, it is a jet engine in which the turbine has been increased in size, so that the exhaust jet can be almost completely robled of its power, and the jet-thrust, therefore, is greatly reduced while the power available at the compressor-turbine shaft greatly increased. This power can then be taken off by gearing to drive a standard propoller.

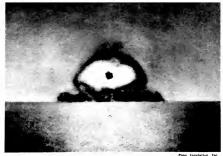

The trouble with the jet engine is that trick of "no-speed; no power." The lower the speed at which the jet moves, the less efficient it is. Below about 400 miles per hour, the propeller is more efficient; above 400, the jet excels. For large transport and freight planes, the gas turbine is better than

the true jet; the jet will be used only for very fast ships such as military craft.

The two engines shown on page 103 are the Westinghouse 19-B and the 91/2-A jet motors. The figures refer to the diameter of the engines, the B signifying it's a second model type. The 19-inch motor is intended for fighter planes; the 91/2 inch job is for self-propelled radio controlled weapons-an American kantikaze, with electronic brains. The little fellow weighs only 145 pounds, and delivers a thrust of 250 pounds-275 horsepower at 375 miles an hour. The rotating unit-the turbine, compressor and shaft are a single unit-in the little one turns over 566 revolutions per SECOND!

The presence of neutrons can sometimes be detected by the naked eye (or, rather, the eye protected by almost opaque goggles).

Phony Atoms

by J. J. COUPLING

We've known about atoms with protons and electrons for a long time; there have been suggestions of atoms with inverted structure—contraterrene atoms. But now it appears there are imitation atoms as well! But the phonies are soon unmasked—the masquerade lasts a few billionths of a second only!

Do you want to be right in on the ground floor of a new scientific discovery? Granted, there's some risk. You may be ahead of the world—or you may be just another sucker, playing the races with the aid of an untrustworthy dope sheet and not knowing until too late that your confidence has heen misplaced. Why not take a chance? There's nothing to lose but your reputation, and if the theory really crosses the line of experiment, think how smart your friends will credit you with being!

When, many years ago, I read Victor McClure's "The Ark of the Covenant." I remember balking at one point. The Ark-a superduner dirigible-was filled with a gas, aithon. I believe, which was lighter than hydrogen. I knew that this just couldn't be so. A hydrogen atom is composed of one negative electron-mass negligible -and a central positive nucleus or proton, itself an elementary particle, having a mass about eighteen hundred times as great as that of the electron. How could there be a lighter atom? If we eliminated the solitary electron, the mass would not be appreciably decreased. and as for the proton, why, that was the very heart and soul of the hydrogen atom. All atoms have heavy particles in their nuclei, and the least nucleus we can have is a

single proton!
As the advertisements say, what is wrong with this picture? Perhaps nothing. In seeking further light, we may as well travel by the tortuous detour actually followed in scientific thought to arrive at a

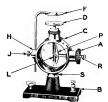

startling—true or false?—new hypothesis.

It used to be that there were few enough elementary particles. We had the elementary positive particle, the proton, or hydrogen nucleus, and the elementary negative particlé, the electron. These two have equal charges but very unequal masses. Together, they were to have been the building blocks of the universe, indivisible elements of which all matter was

to be constituted. This was too good to last. The situation became so had that a cynical scientific friend of mine suggested the universe must be getting out of control, and odd new accidental particles appearing in defiance of earlier scientific law He went on to say that eventually phenomena would become complicated beyond all rational explanation, the cosmos degenerating into a disorder like that of a wound clockworks with the holts loosened: that new sorts of fragments would burden a once rational structure in increasing and finally overwhelming abundance.

as bad as this, and that the discovery of new particles is simply a result of greater astureness on the part of physicists. Such astuteness has consisted partly in the development of new and better apparatus and techniques, and nartly in an increasing care and rigor in interpretation of records and data and in their correlation with accepted theory. Without such correlation, a foggy trace in the saturated vapor of a Wilson cloud chamber would be but a loggy trace; with such correlation it becomes evidence of the transit of a proton, electron, positron, or mesotron

We hope that the situation is not

Company of the Leafual Scientific Company

The electroscope is one of the carliest devices used for detecting particles, Like electric charges on L and P repel one another and cases I, to stand analysis from P. Fast charged particles of ionising radiation cause the charge to leak off, and L directly fall down. The rate of fall is a measure of the intensity of the ionising particles or radiation. Tay electroscopes with the charged when the difference of the charge of the

Whatever the cause, new yarticles did make their appearance.
The first was the neutron, first observed in Germany in 1920 by W. Bothe and H. Becker as a very penetrating maintainen produced when the radiation of pelonium tell on herrillman, horou, or lithiums. Work in 1932 by Irene Curie and Work in 1932 by Irene Curie and in 1932, by Carlowick in England identified this radiation as neutral particles nearly equal in mass to the proton. The neutron is now a respectable component of atomic

nuclei, as well as what may be called the activating force of the have you by chance heard of it? —atom bomb

Other particles followed shortly.

D. Anderson discovered the
positron in 1932, and received the
Nobel prize for doing so. As the
positron is very important to us,
we may pause a moment to say that
it is a particle of electronic mass
having a positive charge equal
aud opposite to that of the electron.
It is very unstable, tending to

surtees of the Central Scientific Company

Light acts in many instances like a stream of particles. The particles are called photons. Unlike material particles, photons travel always with the same speed, 186,000 miles a second. The spectroscope spreads various colors of light into a rainbow along a long narrow operture, and the intensities of different colors can be recorded on a narrow photographic flux. According to the wave theory, the color is a measure of the frequency or rate of vibration of the light; it may also be regarded as a measure of the energy of the photons composing the light. Photons of high frequency bullet light have more energy than photons of low frequency red light. Besides light, infrared, ultraviolet, X, ray and gamma rays are of a photon

combine with a negative electron, leaving nothing bur gamna radiation—a purely electromagnetic disturbance. In fact, according to Dirac, the English now-physicist, once-electrical engineer: whose theoretical predictions anticipated the discovery of this particle, the positive energy level—a place where, by all probabilities, an electron should be traveling with an inaginary momentum, but isn't. This will be perfectly comprehensible to

those who have read the C T—contraterrene matter—stories in Astonnding. In any event, the positron is now as respectable as the neutron, and no physicist of these days would think of doubting it.

Following the positron came the neutrino, a particle of no charge and of very low, perhaps electronic, mass. The neutrino is not directly—meaning, not with the usual minimum of indirectness—observable, but is very handy and

indeed essential as a means for conserving energy and momentum in certain nuclear reactions.

Perhaps I should at this poin mention an interesting but not generally accepted particle. A physicist at the California Institute of Technology set up elaborate apparatus, and, after going through the usual motions, got absolutely no trace on the photographic plate. He immediately

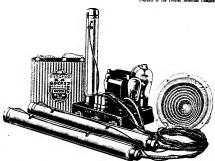

deduced a particle of no charge and no mass, which he named the nonon.

Reverting to serious science, we find Yukawa in 1935 hypothesizing a charged particle of mass intermediate between that of the electron and the proton and of short life. Whether this was a lucky guess or a shrewd prediction, sinilar particles soon appeared. In 1936 Auderson, the same man who

"Geiger-Müller counter"

The long tubes to the fore contain gas at love pressure. A high voltage is applied between electrodes in each tube. When an ionizing particle penerates a tube, it causes a breakdown or gascons discharge—like that in a neon tube. The attacked circuit causes a light to flash or a click from a speaker. In a "coincidence counter" of the type shown, there is a flash or click only if the particle penetrates both tubes. This makes it possible to count particles from a single direction. More elaborate counter circuits have devices kulich tally up the counts, using electronic counter vistems.

Courtery of the Central Scientific Company

The cloud chamber was invented by C. T. R. I'ilson in 1899. The air in a chamber with transparent walls is held at one hindred percent relative humidity. If hen the pressure is suddenly lowered, the water tends to condense as a fog. If an ionizing partiels such as an electron, positron, proton or mesotron passes through the chamber, it leaves behind a trail of ions; the water vapor tends to condense around these, making a foggy track where particles passed. Gamma ross don't show.

had earlier discovered the positive electron or positron, observed them during cosmic ray studies, and they are now accepted under the name mesotron, which he gave them. Sometimes, the mesotron is called the meson. Other christenings, such as barytron and the somewhat friviolous Yukon, have not survived.

Mesotrons are strange creatures.

They are, like positrons, shortlived. Apparently, they are the ephemeral by-products of violent nuclear reactions engendered chiefly by hard, highly energetic cosmic rays. Mesotrons are generally thought of as having a mass about two hundred times that of the electron and approximately electronic charge, either positive or negative. They endure on the average about a millionth of a second. But. either experiments are crude and erratic, or there is something very queer about the mesotron, for some experiments indicate lighter mesotrons, and others seem to indicate mesotrons which may last only a hundred-thousandth of a millionth of a second. In all, there is neither a generally accepted theory of the nature of the mesotron, from which to deduce its mass and charge, nor is there adequate experimental data to pin

Darron 1 Particles of the Cosmic Ray"

If the air is expanded some time after the passage of a charged particle, the ious left behind by the particle will have drifted apart and the fog droplets forming about the ious will be well separated. By constitute the droplets, the ious can be counted, and the ionizing ability of the particle so determined. As the ionizing ability depends on the speed and the nature of the particle, this gives a clue to the particle's identity. (Corson and Brode. University of California.)

down its properties. Or is the mesotron one particle with unique properties? And here comes the new theory.

Professor J. A. Wheeler of Princeton University has recently suggested, with some indirection, that mesotrons might just conceivably be a sort of phony atom. Professor Wheeler modestly calls'the hypothetical particles he discusses electro-microns, insists that

they are in all likelihood quite different from the garden variety of mesotron, and even solicits new and less confusing names. Does he protest too much? Let us see

what he has to say.

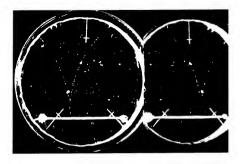

We currently have two more or less complementary pictures of the atom. A hydrogen atom may be considered, for instance, as having a central heavy positive particle, a proton, around which revolves light negative particle, an electron.

Barrow's "Particles of the Countr Bar"

Besides intensity of ionization and curvature of path in a magnetic field, the ability of particles to penetrate metal barriers forms a third clue to their nature. Here we see the track of a mesotron which has penetrate a metal barrier exithout sensible deflection. Aluger, University of Paris.)

Barrow's "Particles of the Cosmic Bus"

This is a steeroscopic view of a Wilson cloud chamber. When there is a strong magnetic field in the chamber, the paths of charged particles are curved. The radius of curvature depends on the charge to mass ratio of the particle and on its speed. Like the intensity of iomization, the path curvature is a clue to the nature of the particle. The photograph shows two particles produced by a photon near the bottom of the picture. As the paths curve in different directions, the particles have opposite charges; they are an electron and a postron. (41) A. Forder, California Institute of Technology.

The massy proton remains practically fixed, as does our sun, and the electron circles it like a planet. This relationship is illustrated in Figure Ia. The alternative picture novolves the nucleus and a sort of vague wave of probability surrounding it: this has been symbolized in Figure Ib. The intensity—illustrated as darkness—of the wave at a given point is a measure of the probability that the electron is in that vicinity.

In either case, according to quantum mechanics, only certain states are possible. In the picture of Figure Ia, these correspond to certain allowed orbits. The state in which the electron is nearest to the nucleus is called the ground state; and represents the usual condition of the atom. For other excited states the orbits are more remote. Atoms are put into these excited states by collision or adiation. If the

electron is torn completely away. the atom is said to be ionized and the atom minus its electron is an ion. As the hydrogen atom has only one electron to lose, the hydrogen ion all that remains after the electron is gone, is merely a proton. If an electron falls back to an excited state orbit or to the ground state, a characteristic spectral line is emitted, and characteristic radiation can also be emitted when an electron falls from an outer to an inner orbit. In the picture of Figure 1b the various states are represented by larger and more complicated wave functions or distributions of probability.

If we find the wave theory disturbing or have difficulty reconciling it with our usual conceptions, perhaps we must be satisfied to know that the theory by which such waves are calculated accurately predicts the properties of hydrogen and many light elements. I might add further that Professor Wheeler and other physicists talk in an easy way first about one picture and then about the other as if the seeming differences were not confusing at all.

Now, what Professor Wheeler has to suggest is just this: Suppose two electronic particles, an ephemeral positron and a negative electron, got together in a sort of double star arrangement, revolving about their common center of gravity, as shown in Figure 2. This is a neutral combination, a sort of phony atom. It has about 1/900 the mass of a hydrogen

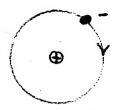

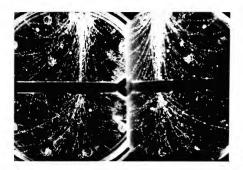

Fig. 1a. •

PHONY ATOMS

Darrow's "Particles of the Cosmic Ray"

A shower of slow electrons. (Anderson and Naddermeyer, California Institute of Technology.)

atom—what a wonderful substance for filling balloons! But is this a mere pipe dream? Perhaps such a system would fly apart, giving off energy as it disintegrated. The methods of wave mechanics

The intentions of wave incensaries, which have been so successfully used in predicting the properties of hydrogen, can be applied to this hypothetical system. The gratifying result is that it should take an energy of about 6.77 electron volts to break up such a system, about half the energy required to remove the electron from a hydrogen atom, ionizing it completely. Thus, the system has a degree of stability. Of course, this system is nothing

like a mesotron. It has only twice

the mass of an electron, not two hundred times. Further, it will eventually commit suicide. Вv suicide I do not mean death by bumping into or by being assaulted by other particles, although such a system would be very delicate in this respect, and certainly could not survive long in our crowded lower atmosphere. Any Methuselah among such combinations would have to live in the uncrowded regions of our very upper atmosphere. To understand the theory of suicide, remember that in Figure 1b, illustrating the wave atom, the darkness at a point in the vague cloud surrounding the nucleus indicates the probability of finding the electron in that vicinity. Now, this probability is greatest in the vicinity of the orbit of the "particle atom" of Figure la but it is by no means zero at the nucleus. A similar condition holds for the positron-electron system of Figure 2, for which I feel quite inconnetent to draw a picture. Such a picture would show that there is a finite probability of the electron and the positron being at the same point. From the theory which has been built up about positrons, it is known that if a positron and an electron get together, within a short time-averaging, say, a time t -the two will combine and produce two gamma-ray photons. Multiplying this mean time of combinations by the probability of coincidence, derived from the wave function, it is found that such a system should persist on the average for a one hundred thousandth of a millionth of a second. In this time, the electron and positron would execute about a hundred thousand revolutions around one another so in this sense the life is

appreciable. If we not such a system into an excited state, that is, add enough energy, say, from a gamma ray, to move the particles into widersweeping orbits, we might expect the chances of annihilation to be less, since the particles are further apart Calculations confirm this. and in fact, indicate that the lifetime increases as the cube of the quantum number-the number of the orbit, counting allowed orbits outward from the nucleus with the

inmost orbit numbered one. As yet, nothing has been said about spin. Electrons and positrons have a certain spin or angular momentum. When, or perhaps I should say if, two of these particles were revolving about one another, the spins could be in the same or in conosite directions. We have in fact been talking entirely about cases in which the spins are opposite. It may be calculated that if the soins were the same, the wave function would be such that the probability of the particles coinciding would be much less, and hence annibilation would take longer to occur. In fact, it would take about a hundred thousand times as long, bringing the life as limited by annihilation up to around a millionth of a second. which is also the life of cosmic-ray mesotrons.

So far we have talked about the properties these electro-mesons or phony atoms would have if they were in existence. What about their formation? Professor Wheeler believes that there is a pretty fair probability of the oppositespin short-lived sort of system being formed by the collision of a commo ray with an atomic nucleus. It is possible that either this sort of pair, or a long-lived system of two particles with the same spins, could be formed simply by the capture of an electron by a positron-really, by a sort of mutual capture—especially in a complicated milieu of many electrons, positrons, and gamma rays. Still, mere speculations about the formation of such particles are unsatisfactory in answering the question: are there such particles?

How could they be detected? We have mentioned that when a hydrogen nucleus (proton) captures an electron, forming a hydrogen atom. a characteristic radiation or spectral line is emitted. Likewise, when the electron falls from an outer, excited state, orbit, to an inner, excited state, orbit, or to the inmost ground state orbitother spectral lines are produced. All of these lines together form the well-known spectrum of hydrogen. Further, by wave mechanics the positions of these lines can be calculated with great exactitude from the mere knowledge that a hydrogen atom consists of a proton and an electron. The agreement between the theoretical and the experimental values is wellnigh perfect, and this gives us confidence that the spectrum of positron-electron pairs should be equally predictable and checkable. Why not merely look for the calcu-

lated spectrum in places where we might find these phony atoms? Here we run into an unprecedented difficulty. The situation would be bad enough if we were to be troubled by the rarity and short endurance of these pairs merely but in addition there istheir unprecedently low mass. If an atom is to be out into an excited state so that it can radi-

ate, it must be struck by something. This may be a material particle or a quantum of electromagnetic radiation. Usually in such an excitation of an atom there is some energy left over, and this appears partly as a change in velocity of the excited atom.

Now, by our gross standards a hydrogen atom is exceedingly light; compared with our hypothetical positron-electron pair it is as massy as the Rock of Gibraltar and just about as immovable. A process of excitation which would leave a hydrogen atom to all intents and purposes stationary would send one of our phony atoms skittering away at a good fraction of the speed of light. What of this? Merely that the spectrum of a group of excited positron-electron systems moving in random directions at such speeds would be so broadened and confused by the Donnler effect that it would be undetectable.

Is there any hope, then, of identifying such particles? If we rely on the spectroscope, there are two possibilities. One, rather remote is that of finding some exciting means which will just barely excite the system with no energy left over to send the particle flying. A more hopeful possibility which Professor Wheeler pointed out is the investigation

of molecular spectra. What is hydrogen chloride but a combination of a negatively ionized chlorine atom with a posi-

tively ionized hydrogen atom?

 $HCI = H \cdot + CI$

A positively ionized hydrogen atom is merely a proton. What about a compound of a chlorine ion and a positron, which we will regard for the moment as a very phony hydrogen ion?

e Cl = e + Cl

Our phony compound, e Cl. is almost as heavy as hydrogen chloride: thus, it cannot be easily knocked about. It should have a molecular spectrum. Will some ingenious experimenter find this spectrum, and the theory'r

But let us return to theorizing and pursue it further. As there are many atoms, in fact, a whole periodic table of them, why should there not be correspondingly many phony atoms? Professor Wheeler has made a first step toward investigating this possibility theoretically, by calculating the energies necessary to separate various combinations of positrons and electrons. Calling M' a combination of an electron and a positron. M** a combination of two positrons and an electron, et cetera, he finds some energies of combination to be

Me 6.77 electron volts M 6.96

Mi over 9.93 electron volts

This tells us that M** or M* cannot spontaneously break up into

M+ plus a positron or electron, for such a transformation require, an

M---

addition of energy. Further, M --cannot become M'- or M-. If the energy, which we only know to be larger than 9,93 electron volts, is actually greater than two times 6.77 or 13.54 electron volts-as it may well be-M'- could not break up into 2M . As the phony elements become more complicated, it is increasingly difficult to calculate their properties, and we still wonder, can there be a system of, say, one hundred one positrons and one hundred electrons? Such a system would

have the charge and mass of a cosmic ray mesotron. Can this be what some cosmic ray mesotrons are? We would feel better equipped to answer if we had some further information about mesotrous Particularly, we want to know:

(1) Do mesotrous have various lifetimes comparable to the spread predicted for phony atoms?

(2) A phony atom would be physically very large compared with a simple particle such as a proton. Is this consistent with the behavior of mesotrons (3) Do mesotrons ever decay

partially into particles of smaller mass and perhaps of different charge, as phony atoms might? (4) Do mesotrons always have masses integral multiples of the electronic mass-as phony atoms

would, very nearly? To answer these questions will require further theoretical probing and experimental work of hitherto

anattained accuracy. At any rate, you are in on the

THE END

ground floor!

111

Placet Is A Crazy Place

It wasn't that Placet itself was so crazy; it was just that the things Placet's gravitic situation did to human sensory organs was really remarkable. You could even solve impossible problems quite unintrationally—

Illustrated by Swenson

Even when you're used to ft, it because Placet time would be as gets you down sometimes. Like screey as everything else on that that morning—If you can call it a goofy planet. I mean, you'd have morning. Really, it was night. a six-hour day and then a two-But we go by Earth time on Placet bour night and then a fifteen-hour

day and a one-hour night andwell, you just couldn't keep time on a planet that does a figure-eight orbit around two dissimilar suns, going fike a bat out of hell around and between them, and the suns oping around each other so fast and so comparatively close that Earth astronomers thought it was only one sun until the Blakestee expedition landed here twenty

You see, the rotation of Placet isn't any even fraction of the period of its orbit and there's the Blakes-lee Field in the middle between the suns—a field in which light rays slow down to a crawl and get left behind and—well—
If you're not read the Blakes-

years ago.

lee reports on Placet, hold on to something, white I tell you this: Placet is the only known planet that can eclipse itself twice at the same time, run headlong into itself every forty hours, and then chase itself and of sight.

I don't blame you.

I didn't believe it either, and it

and the server it critical state. In the server it is a server it

morning. I was sitting at my

desk, the top of which was covered me with grass. My feet were—or the seemed to be—resting on a sheet as, of rippling water. But it wasn't

On top of the grass of my desk lay a pink flowerpot, into which, nose-first, stuck a bright green Saturnian lizard. That-reason and not my evesight told me-was my pen and inkwell. Also an embroidered sampler that said "God Bless Our Home" in next cross-stitching. It actually was a message from Earth Center which had just come in on the radiotype. I didn't know what it said because I'd come into my office after the B. F. effect had started. I didn't think it really said "God Bless Our Home" because it seemed to. And just then I was mad, I was fed up, and I didn't care a holler what

it actually did say.

You see-maybe I'd better explain-the Blakeslee Field effect occurs when Placet is in midposition between Argyle I and Areyle II, the two suns it figureeights around. There's a scientific explanation of it, but it must be expressed in formulas, not in words. It boils down to this: Argyle I is terrene matter and Argyle II is contraterrene, or negative matter. Halfway between themover a considerable stretch of territory-is a field in which light rays are slowed down, way down, They move at about the speed of sound. The result is that if something is moving faster than sound -as Placet itself does-vou can still see it coming after it's passed

Let me explain; it who may before you get dizzy. Say an oldfashioned locomotive is coming toward you, only at a speed much faster than sound. A mile away, it whistles. It passes you and then you hear the whistle, coming from the point a mile lack where the locomotive init any more. That's the auditory effect of an object traveling faster than sound; what I've just described is the visual effect of an object traveling—in a own visual insure.

That isn't the worst of it; you can stay indoors and avoid the celipsing and the head-on collisions, but you can't avoid the physio-psychological effect of the Blakeslee Field.

And that, the physic-psychological effect, is something else again. The field does something to the optic nerve centers, or to the part of the brain to which the optic nerves connect, something similar to the effect of certain drugs. You have you can't exactly call them halbcinations, because you don't

f ordinarily see things that aren't t there, but you get an illusory picture of what is there.

I knew perfectly well that I was sitting at a desk the top of which was glass, and not grass; that the floor under my feet was ordinary plastiplate and not a sheet of rippling water: that the objects on my desk were not a pink flowerpot with a Saturnian lizard sticking in it, but an antique twentieth century inkwell and pen -and that the "God Bless Our Home" sampler was a radiotype message on ordinary radiotype paper. I could verify any of those things by my sense of touch. which the Blakeslee Field doesn't affect.

You can close your eyes, of course, but you don't—because even at the height of the effect, your eyesight gives you the relative size and distance of things and if you stay in familiar territory your memory and your reason tell you what they are.

So when the door opened and a two-headed monster walked in, I knew it was Reagan. Reagan isn't a two-headed monster, but I could recognize the sound of his walk

walk.
I said, "Yes, Reagan?"

The two-headed monster said, "Chief, the machine shop is wobbling. We may have to break the rule not to do any work in midperiod."

"Birds?" I asked. Both of his heads nodded. "The

underground part of those walls

must be like sieves from the birds flying through 'en, and we'd better pour concrete quick. Do you think those new alloy reinforcing bars the .frk'll bring will stop them?"

"Sure," I held Forgetting the field, I turned to look at the clock, but there was a funeral wreath of white libes, out the wall where the clock should have been. You can't tell time from a funeral weath of white libes, and a funeral weath I said, "I was looping as wouldn't have to reinforce these walls this we had the lars to sink in them. The Jrk's about their they probably havering outside right probably havering outside right probably havering outside right with the control of the field. You think we could wait till—I There tows a crash.

"Yeah, we can wait," Reagan said. "There went the machine shop, so there's no hurry at all." "Nobody was in there?"

"Nope, but I'll make sure." He ran out

That's what life on Placet is like I've had enough of it; I'd had too much of it. I made up my mind while Reagan was gone.

When he came back, he was a bright blue articulated skeleton. He said, "O. K., Chief. Nobod.

He said, "O. K., Chief. Nobodi was inside."

"Any of the machines hadly

smashed?"

He langhed, "Can you look at a rubber beach horse with purple polla dots and tell whether it's an intact lathe or a busted one? Say, chief, you know what you look like?"

I said. "If you tell me, you're fired."

I don't know whether I was skidding or not: I was plenty on edge. I opened the drawer of my office of the plant of the controlled the controlled the drawer of my House's suppler in it and slammed the drawer shin. I was fed up, stay there long emongh you go stay there long emongh you go stay there long emongh you go farth Center's Placet employees has to go back to Earth for psychpublic treatment after a year or two on Placet. And Td been there three years, amout. My contract three years, amout. My contract

"Reagan," I said. He'd been heading for the door.

He turned. "Yeah, chief?"

I said, "I want you to send a
me message on the radiotype to Earth
Center. And get it straight, two
words; I quit"

He said, "O. K., chief." He went on out and closed the door.

I sat back and closed my eves

to think. I'd done it now. Unles-I ran after Reagan and told him not to send the message, it was done and over and irrevocable. Earth Center's funny that way; the board is plenty generous in some directions, but once you re-

some directions, but once you resign they never let you change
your mind. It's practically at
i iron-chaf rule and ninety-nine times
out of a hundred it's justified on
interplanetary and intragalactic,
projects. A man must be a hundred percent enthusiastic about his
job to make a go of it, and once

it now. Back to Earth and a he's turned against it, he's lost the teaching job again, Forget it. keen edge. I knew the midneriod was about

over, but I sat there with my eyes closed just the same. I didn't want to open them to look at the clock until I could see the clock as a clock and not as whatever it might be this time. I sat there and

thought. I felt a bit hurt about Reagan's casualness in accepting the message. He'd been a good friend of mine for ten years; he could at least have said he was sorry I was going to leave. Of course, there was a fair chance that he might get the promotion, but even if he was thinking about that, he could have been diolomatic about it. At least, he could have-

Oh, auit feeling sorry for yourself. I told myself. You're through with Placet and you're through with Earth Center, and you're going back to Earth pretty soon now, as soon as they relieve you, and you can get another job there, probably teaching again,

But darn Reagan, just the same. He'd been my student at Earth City Poly, and I'd got him this Placet iob and it was a good one for a voungster his age, assistant administrator of a planet with nearly a thousand population. For that matter, my job was a good one for a man my age-I'm only thirty-one myself. An excellent iob, except that you couldn't put up a building that wouldn't fall down again and-Quit crubbing, I told myself; you're through with

122

I was tired. I put my head on my arms on top of the desk, and I must have dozed off for a min-

nte I looked up at the sound of footsteps coming through the doorway:

they weren't Reagan's footstens. The illusions were getting better now, I saw. It was-or appeared to he-a gorgeous redhead. couldn't be, of course. There are a few women on Placet, mostly wives of technicians, but-

She said, "Don't you remember me. Mr. Rand?" It was a woman; her voice was a woman's voice, and a beautiful voice. Sounded vaguely familiar, too. "Don't be silly," I said; "how

can I recognize you at midper-" My eyes suddenly caught a glimpse of the clock past her shoulder, and it was a clock and not a funeral wreath or a cuckoo's nest, and I realized suddenly that everything else in the room was back to normal. And that meant midneriod was over, and I wasn't scrine

things. My eyes went back to the redhead. She must be real, I realized. And suddenly I knew her, although she'd changed, changed plenty. All changes were improvements, although Michaelina Witt had been a very pretty girl when she'd been in my Extraterrestrial Botany III

class at Earth City Polytech four . . . no, five years ago. She'd been pretty, then. Now

she was beautiful. She was stun-

ning. How had the teletalkies missed her? Or had they? What was she doing ktrrt. She must have just got off the Ark, but— I realized I was still gawking at her. I stood up so fast I almost fell across the desk.

"Of course I remember you, Miss Witt," I stammered. "Work' you sit down? How did you come here? Have they relaxed the novisitors rule?"

She cheek her bead emilling

She shook her bead, smiling. "I'm not a visitor, Mr. Rand. Center advertised for a technician-secretary for you, and I tried for the job and got it, subject to your approval, of course. I'm on probation for a month, tiau is." "Wonderful," I said. It was

a masterpiece of understatement.

I started to elaborate on it:
"Marrelous—"

There was the sound of someone clearing his throat. I looked

crearing his throat. I looked around; Reagan was in the doorway. This time not as a blue skeleton or a two-beaded monster. Just plain Reagan. He said, "Answer to your radio-

He said, "Answer to your radiotype just came." He crossed over and dropped it on my desk. I looked at it. "O. K. August 19th." it read. My momentary wild hope that they'd failed to accept my resignation went down among the widgie birds. They'd been as brief

about it as I'd been.

August 19th—the next arrival of the Ark. They certainly weren't wasting any time—mine or theirs. Four days!

Reagan said, "I thought you'd want to know right away, Phil." PLACET 18 A CRAET PLACE

aldies "Yeah," I told him. I glared at What him. "Thanks." With a touch of must spite-or maybe more than a touch in the distribution of the Arts.

But I didn't say that; the veneer of civilization was too thick. It said, "Miss Witt, I'd like you to meet—" They looked at each other and started to laugh, and I remembered. Of course, Reagan and Michaelina had both been in my hotany class as had Michaelina had both been in my hotany class as had Michaelina's

Michaelina had both been in my botany class, as had Michaelina's twin brother, Ichabod. Only, of course, no one ever called the redheaded twins Michaelina and Ichabod. It was Mike and Ike, once you knew them.

Reagan said, "I met Mike setting

off the Ark. I told her how to find your office, since you weren't there to do the honors."

"Thanks," I said. "Did the

reinforcing bars come?"

"Guess so. They unloaded some crates. They were in a hurry to pull out again. They've gone."

I grunted.

Reagan said, "Well, I'll check
the ladings. Just came to give you
the radiotype; thought you'd want
the good news right away."

He went out, and I glared after him. The louse. The— Michaelina said. "Am I to start to work right away, Mr. Rand?" I straightened out my face and

I straightened out my face and managed a smile, "Of course not," I told her. "You'll want to look around the place, first. See the scenery and get acclimated.

Want to stroll into the village for a drink?" "Of course."

We strolled down the path toward the little cluster of buildings, all small, one-story, and

square. She said, "It's . . . it's nice,

Feels like I'm walking on air. I'm so light. Exactly what is the

gravity?" "Point seven four." I said. "If you weigh . . . um-m. a bundred

twenty pounds on Earth, you weigh about eighty-nine pounds here. And on you, it looks good."

She laughed. "Thank you, professor- Oh, that's right: you're not a professor now. You're now my boss, and I must

call you Mr. Rand." "Unless you're willing to make it Phil. Michaelina," "If you'd call me Mike: I detest

Michaelina, almost as much as Ike hates Ichahod" "How is lke?" "Fine Has a student-instructor

job at Poly, but he doesn't like it much." She looked ahead at the village. "Why so many small buildings instead of a few bigger ones?"

"Because the average life of a structure of any kind on Placet is about three weeks. And you never know when one is going to fall down-with someone inside. It's our biggest problem. All we can do is make them small and light, except the foundations, which we make as strong as possible. Thus

far, nobody has been hurt seriously in the collapse of a building, for that reason, but- Did you feel that?" "The vibration? What was it. an carthouake?"

"No." I said. "It was a flight of birds,"

"What?"

I had to laugh at the expression on her face. I said, "Placet is a crazy place. A minute ago, you said you felt as though you were walking on air. Well, in a way, you are doing just exactly that,

Placet is one of the rare objects in the Universe that is composed of both ordinary and heavy matter. Matter with a collapsed molecular structure, so heavy you couldn't lift a pebble of it. Placet has a core of that stuff; that's why this tiny planet, which has an area

about twice the size of Manhattan Island, has a gravity three-quarters that of Earth. There is lifeanimal life, not intelligent-living on the core. There are birds, whose molecular structure is like that of the planet's core, so dense that ordinary matter is as tenuous to them as air is to us. They

actually fly through it, as birds on Earth fly through the air. From their standpoint, we're walking on top of Placer's atmosphere."

"And the vibration of their flight under the surface makes the houses collegue ?"

"Yes, and worse-they fly right through the foundations, no matter what we make them of. Any matter we can work with is just so much gas to them ASTOUNDING SCIENCE-FICTION

through iron or steel as easily as through sand or loam. I've just got a shipment of some specially tough stuff from Earth—the special alloy steel you heard me ask Reagan about—but I haven't much hope of it doing any good."

"But aren't those birds dangerous? I mean, aside from making the buildings fall down. Couldn't one get up enough momentum flying to carry it out of the ground and into the air a little way? And wouldn't it go right through any-

one who lappened to be there?"
"It would," I said, "but it doesn't.
I mean, they never fly closer to the surface than a few feet. Some sense seems to tell them when they're nearing the top of their atmosphere. Something analogous to the supersonics a but uses. You know, of course, how a but can fly in utter darkness and never fly into a solid object."

"Like radar, yes, except a buses sound waves instead of radio waves. And the widgie birds must use something that works on the same principle, in reverse; turns them back a few feet before they approach what to them would be the equivalent of a vacuum. Being heavy-matter, they could no more exist or fly in air than a bird could exist or fly in air than a bird could reverse the could be a second of the exist or fly in a vaccuum.

"Like radar, ves."

While we were having a cocktall apiece in the village, Michaelina mentioned her brother again. She mid, "Ike doesn't like teaching at all, Phil. Is there any chance at all that you could get him a job here on Place?"

I said, "I've been badgering Earth Center for another administrative assistant. The work is increasing picnty since we've got more of the surface under cultivation. Reagan really needs belp. I'll..."

Her whole face was alight with eagerness. And I remembered. I was through. I'd resigned, and Earth Center would pay as much attention to any recommendation of mine as though I were a widgie bird. I finished weakly, "I'll... I'll see if I can do anything

about it."

She said, "Thanko—Phil." My land was on the table heside my glass, and for a second she patt here over it. All right, it's a tackle need on teach port to say it felt as though a high-voltage current went through me. But it did, and it was a mental shock as well as a physical one, because I realized the and there that I was head over becks. It'd fallen larslet than any

of Placet's buildings ever had.

The thumo left me breathless. I

wasn't watching Michaelina's face.

but from the way she pressed her hand harder against mine for a millisecond and then jerked it away as though from a flame, she must have felt a little of that current, too.

I stood up a little shakily and suggested that we walk back to

headquarters.

Because the situation was completely impossible, now. Now that Center had accepted my resignation and I was without visible or psychotic moment, I'd cooked my own goose. I wasn't even sure I could get a teaching job. Earth Center is the most powerful organization in the Universe and has a finger in every pic. If they

blacklisted me— Walking back, I let Michaelina do most of the talking; I had some beavy thinking to do. I

some heavy thinking to do. I wanted to tell her the truth-and I didn't want to.

Between monosyllabic answers, I fought in our with myself. And, finally, lost. Or won. I'd not sell her—until just before the next coming of the Ark. I'd peetend everything was O. K. and normal for that long, give myself that much chance to see if Michaelins would fall for me. That much of a break I'd give myself. A chance, for four days.

And then—well, if by then alse'd come to feel about mer he way I did about her, I'd tell her what a fool I'd been and tell her I'd like to— No, I wouldn't let her return to Earth with me, even if she wanted to, until I saw light alsead through a loggy future. All I could tell her was that if and when way up again to a decent job—and after all I was still only thirty-one and might be able to—

and might be able to— That sort of thing.

Reagan was waiting in my office, looking as mad as a wet hornet. He said, "Those saps at Earth Center shipping department gummed things again. Those crates of special steel—aren't. "Aren't what?"

"Aren't anything. They're h empty crates. Something went d wrong with the crating machine

and they never knew it."
"Are you sure that's what those

crates were supposed to contain?"
"Sure I'm sure. Everything

"Sure I'm sure. Everything else on the order came, and the ladings specified the steel for those particular crates." He ran a hand through his tousled hair. It made him look more like an airedale than he usually does.

I grinned at him. "Maybe it's invisible steel." "Invisible, weightless and intan-

gible. Can I word the message to Center telling them about it?"
"Go as far as you like," I told him. "Wait here a minute, though.

I'll show Mike where her quarters are and then I want to talk to you a minute."

I took Michaelina to the best

available sleeping cabin of the cluster around headquarters. She thanked me again for trying to get like a job here, and I felt lower than a widgie bird's grave when I went back to my office. "Yeah, chief?" Resean said.

"About that message to Earth," I told him. "I mean the one I sent this morning. I don't want you to say anything about it to Michaelina"

He chuckled. "Want to tell her yourself, huh? O. K., I'll keep my yap shut."

I said, a bit wryly, "Maybe I was foolish sending it."

"Huh?" he said. "I'm sure glad von did. Swell idea."

He went out, and I managed not to throw anything at him.

The next day was a Tuesday, if that matters. I remember it as the day I solved one of Placet's two major problems. An ironic time

to do it, maybe. I was dictating some notes on greenwort culture-Placet's importance to Earth is, of course, the fact that certain plants native to the place and which won't grow anywhere else yield derivatives that have become important to the pharmacopoeia. I was having heavy sledding because I was watching Michaelina take the notes; she'd insisted on starting

work her second day on Placet. And suddenly, out of a clear sky and out of a muggy mind, came an idea. I stopped dictating and rang for Reagan. He came in.

"Reagan," I said, "order five thousand ampoules of I-17 Conditioner. Tell 'em to rush it."

"Chief, don't you remember? We tried the stuff, Thought it might condition us to see normally in midperiod, but it didn't affect the optic nerves. We still saw screwy. It's great for conditioning people to high or low temperatures or-"

"Or long or short wakingsleeping periods," I interrupted him. "That's what I'm talking about, Reagan. Look, revolving around two suns, Placet has such short and irregular periods of light and dark that we never took them

seriously. Right?" "Sure, but-"

"But since there's no logical Placet day and night we could use. we made ourselves slaves to a sun so far away we can't see it. We use a twenty-four hour day. But midperiod occurs every twenty hours, regularly. We can use conditioner to adapt ourselves to a townty-hour day-six hours sleep, twelve awake-with everybody blissfully sleeping through the period when their eyes play tricks on them. And in a darkened sleeping room so you couldn't see anything, even if you woke up. More and shorter days per year-and nobody goes psychopathic on us. Tell me what's wrong with it." His eyes went bleak and blank and he hit his forehead a resound-

ing whack with the palm of his hand. He said, "Too simple, that's what's wrong with it. So darned simple only a genius could see it. For two years I've been going slowly nuts and the answer so easy nobody could see it. I'll put the order in right away."

He started out and then turned back. "Now how do we keep the buildings up? Quick, while you're fey or whatever you are " I laughed. I said, "Why not try

that invisible steel of yours in the empty crates?"

He said. "Nuts." and closed the door.

And the next day was a Wednesday and I knocked off work and ASTORNOUS SCIENCE SIGNION

took Michaelina on a walking tour around Placet. Once around is just a nice day's hike. But with Michaelina Witt, any day's hike would be a nice day's hike. Excent, of course, that I knew I had only one more full day to spend with her. The world would end on Friday.

Tomorrow the Ark would leave Earth, with the shipment of conditioner that would solve one of our problems-and with whomever Earth Center was sending to take my place. It would warp through space to a point a safe distance outside the Argyle I-II system and come in on rocket power from there. It would be here Friday, and I'd go back with it. But I tried not to think about that. I pretty well managed to forget

it until we got back to headquarters and Reagan met me with a grin that split his homely mug into horizontal halves. He said, "Chief, you did it."

"Swell." I said. "I did what?" "Gave me the answer what to use for reinforcing foundations You solved the problem."

"Yeah?" I said

"Yeah. Didn't he, Mike?" Michaelina looked as puzzled as

I must have. She said, "He was kidding. He said to use the stuff in the empty crates, didn't he?" Reagan grinned again. "He just

thought he was kidding. That's what we're going to use from now on. Nothing. Look, chief, it's like the conditioner-so simple we never thought of it. Until you told me to use what was in the empty

FROM THE PAST

An ald Egyptian secret, a vialated tomb and an ancient curse bring death and destructian ta a graup of helpless peaplet

What was the farmula on the papyrus manuscript far whase secret men were willing to fight and die?

The Shadaw, alias Lamant Cranstan, meets his fiercest appanent in a strange bird creature who holds the answer to THE CURSE OF THOTH. Read this thrilling, chilling tale in the May issue af

THE SHADOW ALL NEWSSTANDS crates, and I got to thinking it over."

I stood thinking a moment myself, and then I did what Reagan had done the day before—hit myself a whack on the forehead with the heel of my palm.

Michaelina still looked puzzled.

"Hollow foundations," I told her. "What's the one thing widgie birds won't fly through? Air. We can make buildings as big as we need them, now. For foundations, we sink double walls with a wide air space between. We can—"

I stopped, because it wasn't "we" any more. They could do it after I was back on Earth looking for a job.

And Thursday went and Friday came.

I was working, up till the last ...ninute, because it was the easiest thing to do. With Reagan and Michaelina helping me, I was making out material lists for our new construction projects. First, a three-story building of about forty rooms for a headquarters building.

We were working fast, because it would be midperiod shortly, and you can't do paper work when you can't read and can write only by feel.

But my mind was on the Ayk. I picked up the phone and called the radiotype shack to ask about it.

"Just got a call from them," said the operator. "They've warped

in, but not close enough to land before midperiod. They'll land right after."

"O. K.," I said, abandoning the

hope that they'd be a day late.

I got up and walked to the window. We were nearing mid-

position, all right. Up in the sky to the north I could see Placet coming toward us.

"Mike," I said. "Come here."

She joined me at the window and we stood there, watching. My arm was around her. I don't remember putting it there, but I didn't take it away, and she didn't move.

Behind us, Reagan cleared his throat. He said, "I'll give this much of the list to the operator. He can get it on the ether right after midperiod." He went out and shut the door behind him.

Michaelina seemed to move a little closer. We were both looking out the window at Placet rushing toward us. She said, "Beautiful, isn't it, Phil?"

"Yes," I said. But I turned, and I was looking at her face as I said it. Then—I hadn't meant to —I kissed her.

I went back, and sat down at my desk. She said, "Phil, what's the matter? You haven't got a wife and six kids hidden away somewhere, or something, have you? You were single when I had a crush on you at Earth Polytech—and I waited five years to get over it and didn't, and finally wangled a job on Placet just to— Do I have to do the proposing the property of the property of the proposing have to do the proposing the property of the property of

I grouped. I didn't look at her. I said, "Mike, I'm nuts about you. But-just before you came, I sent a two-word radiotype to Earth. It said. 'I quit.' So I've got to leave Placet on this shuttle of the Ark, and I doubt if I can even set a teaching job. now that I've got Earth Center down on me, and-"

She said, "But, Phill" and took

a step toward me. There was a knock on the door. Reagan's knock. I was glad, for once, of the interruption. I called

out for him to come in, and he opened the door. He said, "You told Mike yet, chief?"

I nedded, glumly.

Reagan grinned, "Good," he said: "I've been busting to tell her. It'll be swell to see Ike again," "Huh?" I said. "Ike who?"

Reagan's grin faded. He said, "Phil, are you slipping, or something? Don't you remember giving me the answer to that Earth Center radiotype four days ago, just before Mike got here?"

I stared at him with my mouth open. I hadn't even read that radiotype, let alone answer it. Had Reagan gone psychopathic, or had I? I remembered shoving it in the drawer of my desk. 1 jerked open the drawer and pulled it out. My hand shook a little as I read it.

REQUEST FOR ADDITIONAL AS-SISTANT GRANTED WHOM DO YOU WANT FOR THE JOB?

I looked up at Reagan again. I said, "You're trying to tell me I sent an answer to this ?"

He looked as dumfounded as I

"You told me to," he said, "What did I tell you to send?"

"Ike Witt." He stared at me. "Chief, are you feeling all right?" I felt so all right something

seemed to explode in my head. I stuod up and started for Michaelina. I said, "Mike, will you marry me?" I got my arms around her, just in time, before midneriod closed down on us, so I couldn't see what she looked like, and vice versa. But over her shoulder I could see what must be Reagan. I said, "Get out of here, you ape," and I spoke quite literally because that's exactly what he appeared to

be. A bright vellow are. The floor was shaking under my feet, but other things were happening to me, too, and I didn't realize what the shaking meant until the ane turned back and velled, "A flight of birds going under us. chief! Get out quick before..." But that was as far as he got before the bouse fell down around us and the tin roof hit my head and knocked me out. Placet is a crazy place. I like it.

Pattern for Conquest

by GEORGE O. SMITH

Conclusion. The true nature of conquest isn't always easy to determine—as a completely overwhelmed and conquered Earth had to demunstrate, It's so impractical to enslave a man brighter thun you are—

Illustrated by Kiloair

Synopsis

Because of their opposing natures. Childra Lanc and Steller Duraing are chosen for a mission by Toralen Ki and Hotting Lu, who are the Little Men of Tienho. Coordinator Kennebec, the nominal reiter of the Solar Combines, sends Billy Thompson along to keep the other keep control of the Mental Company of the Company o

ford Lane are attracted to Potricia Kennebec, which is just another source of their never-ending battle.

The mission, not entirely understead by the Terrans, consists of destroying a machine sent forth by the Lord-wogh, are that is conquering the Glassy on a tecntythousand-year program. This machine retricts mental squirily through a vast area, thus permitting the Lord-wogh to advance without difficulty. Communication between the Line People of Hembe and Terrams is also restricted by the machine, and so the true nature

of the mission is not really known. The three, Thompson, Downing, and Lane, take their commands and sally forth to destroy the machine. They find it passing through the system of Secanton, a stellar system populated with a race that evolved. from the foliae instead of the primate. The falien reace attacks viciously, resenting any interference, and they succeed in capturing Chifford Lanc. Downing and Thompson est up a planet-mounted encapturent on Sixonstoo I and proceed to convect once of the cottoner, type of exceptors to their own concept, improving it considerably. Meanwhile, Lans makes the acquisition of the constraints of the control of the Sixonstoner, and succeeding the Sixonstoner, and where for the baseful of civiliations.

a cutting sphere on the end of a boam, is used by Thompson and Downing as they return. This cutting sphere tilece a midsection out of the catment's spacecraft, proving the ability of the Terrans. Between Clifford Land's extraorered nature and Downing's executive and Downing's executive coupled with Thompson's securities, coupled with Thompson's securities they must premai the Terrans to search through their system without interference.

At the same time, the super weapon,

The machine is found and destroyed, and the eternal rivals, their mission finished, go out to enjoy a bit of "rivet-cutting" which is a spaceborne version of the game of seeing how close they can come to ame another visitions hilting. In other words, they are trying to fly the other out of space, in order to make him admit inferiorism.

the other out of space, in order to make him admit inferiority. With the mental suppressor destroyed, Toralen Ki it able to communicate with Thompson through a telementor. Learning of the

e excised and commands. Thempson is to arder it stepped. The Feason is that Lane and Downland, being of opposite personalities, being of opposite personalities in a shock-excited passed intendibites in a shock-excited passed distinon, once they return in Terra. This will release all Terram minds from the mental lethangy caused by twenty thousand years of the mental subgregation.

tal suppressor.
Thompson smiles tolerantly and
shakes his head, and Torolen Ki discovers that Billy is under the can-

trol of the Loard-vogh.

Torales Ki, fighting for his life,
invades Thompson's mind and a
terrific mental struggle takes place
which ends as Thompson's own
mind becomes energised due to the
mental shock. Thompson forces
the Loard-vogh out, killing kinn as
he manihaltes his machine back on

his home planet.

Lane and Downing are ordered to stop, which they do, finally. The party returns to Terra, and the mental transfer takes place. The transfer causes Toralen Ke's death.

This does not immediately increase the mentalities of all Terrans. They have the ability for increased mentality, but lack the practice. experience, and necessary

knowledge.

Meanwhile, Vergoon, Lord of All, Ruler of the Loard-vogh, consults with Lindoo, his Head of Strategy, and they decide that with the mental suppressor destroyed and the energiation howing succeeded, that they must abandon their original plan and attack Terra immediately. They begin to make plans and start the wakets of a stack in motion.

Toralen Ki is gone, but Hotang Ly informs the Terrans that Sol is in the center of a "mutation area" caused by the explosion of a contraterrene sun many thousand years ago. The stellar bits are still dropping into suns in this area, causing a heavy bombardment of cosmic rays, causing mutation much faster than in other galactic locations. Solar bacterial, fungus, insect, and even animal life has evolved swiftly and danacrously for all of the rest of the Golaxy, and Lane admits havina killed a Sscantovian quinea big by merely holding it in his hand and innoculating it with fungus that to Lane is innocuous. The Loard-week know of Terra and Sal and to them, the name of Sal III

Still improving the cutting sphere, Thompson, leaving mental twinship with both Toraten Ki and the Loard-vogh known as Kregar, evolves on domic sphere that compresses a small sphere of matter in any target, and then lets it explode. This produces a terrible atomic exolosion.

is the "Planet of Terror."

Lane and Downing, being emotional opposites, find in their mental twinship that they no longer have their individual adultive because of indecisions created by the opposing factors. Thompson, meanwhile these commands because of his salities, and Patricia Kennobec, long undecided between Lane and Downing, finds emotional stability in Billy Thompson.

The Loard-vogh attack, and Terra fights them all the way from the far interstellar outposts right down to Terra itself. Thompson tells of a secret weepon that must not be used until the time is ripe, and though all bearings but Laus and Downing understand it, the Tlembon cannot understand Thompson's reasoning, and flyings Liv becomes bitter because Thompson does not emboy it immediately.

The Loard-coph involved Terra, and can not be stopped. Incrorably they cover the ylanet, dying like flies because of the terrible microscopic growths found on Terra. But their mumbers permit such devastation, and they continue to pour men and machines in until Terra is completely overnoptely of the property of the pour men and machines in until Terra is completely overnoptely.

Kenwicke, Thompson, Lane, Comming, and Patricia are taken to the Loral-wook encomposent to the Loral-wook encomposent to the the Loral-wook encomposent to the encounter the encounter of the enc

XVII.

Lindoo's return from the Solar Scotor was that of a conqueror. There were speeches and parades, and public demonstrations; and the hours wore by interminably, Lindoo knew just how important his victory had been, and yet how obvious had been his chances of winning. Even the Head of Strategy of a proud and tyrannical race could feel within him the seeds of discontent. He suffered the publicity because such propaganda was necessary, and as soon as he could, he sought private audience with Vorgan.

"Hail the conquering hero," greeted Voreau, as Lindon entered, The tone was slightly sarcastic.

Lindoo was not hurt. "How many know?" be asked the Lord of

"Very few--thunks to a pleased fate "

"But we know," said Lindoo bitterly. "What a victory. A bulldozer crushing an ant hill; a pile driver smashing eggs; an elephant

warding off mosquitoes." "And yet," Vorgan told him, "unlimited freedom would build the ant hill beyond the ability of the buildozer, and the mosquitoes could smother the elephant if their num-

bers filled the atmosphere. It was meressary " Lindoo nodded. "We lost seventeen million of our first-line fight-

ing men. They were bitter opnonents." "Think of what might have happened if they'd expanded for an-

other two thousand years." "That would be double their scientific history. I think," agreed Lindoo. "They've been expanding on a high order exponential curve. Another two thousand years would have put a barrier across the Galaxy with the Solar Sector at the center, and the Loard-vogh might never complete their plan. We acted rightly. Vorgan. But in spite in spite of the danger to our plans. I feel that there is something strictly awry. They are an intelligent race. They must have known their inability to win-vet they fought like demons. We could well afford to lose seventeen million expendables.

They could not, yet-?" "Did they?"

"They must have. Our forces may have been overeager. An at-

tacking force usually loses more than the defending force. Our fighter psychology is more battleminded than theirs, for our soldiers are trained to think only in terms of battle. But even so, Vorgan, the tacticions and statisticions estimate that we could have lost no more than two to one. And granting that, it means a loss of eight and one half million men lost from the Solar Sector."

Vorsan thought that over, "They could ill afford to lose that many of their prime citizens," "And knowing that, and know-

ing that they are of a high order of intelligence, I ask again: Why did they fight?" "Could it have been sheer des-

peration?" "There was calculated strategy in their battle plan. There was a purpose, I tell you. It is obscure to me, but there was a definite plan. and no plan is executed without a

purpose. "Could they have hoped to hold

"Never. They knew our strength. They knew our plan. They understood our ourpose, and they recog-

nized our determination. Does the weakling, knowing all factors, fight against his superior?"
"It might have been the deter-

mination—knowing they must lose—to take as many enemies with them as possible."
"The cornered rat technique?"
"It has been done before." ob-

"It has been done before," observed Vorgan.

Lindon agreed. "You were not

there," he told the Lord of All "Their plan hore the stamp of a superior strategist who had some purpose in mind. A purpose that required him to fight a losing battle for other reasons than the cornered rat technique. You see, Vorgan, the cornered rat technique presenta rather peculiar psychological problem. It is a snicide-fighter's psychology. And snickle fighters operate in a vastly different manner than a man who is fighting for something beyond the abstract concepts of a victory for his contenpopuries and his descendants. Even the most victous and well-trained of suicide fighters is interior to a reasonably well trained man wrested from his home and impressed for service. The psychology of the

suicide fighter évolves into a seeking-for-death technique, which lessens his survival factor over a man fighting to preserve his integrity and lighting to get the hattle over with so that he can go home and resume his daily life. We know that. That is why the Land-twooth

fighter is supreme. He is no smeddfighter. He is vicious because he has been wrested from his bome and family, and his tenure of ASTOUNDING SCIENTE PICTION

service depends upon his ability. Since a victorious soldier is mustered out of arms and sent home sooner than a lax one, it urges all men to perform great deeds, act in a superior manner, and to be victorious in the shortest time so that he may return to his daily life. The Terrans are far from suicide fighters, Lord of All. Their theories of warfare are similar to ours. In fact," smiled Lindoo thoughtfully, "every race that offers us a stiff resistance seems to have come to that conclusion." "Then what was their purpose?

Seems to me that they must have been fighting for something." "I don't know. They will fight if outnumbered, of course. The

value of survival factor. That, coupled with high intelligence, should indicate that surrender offers the greater number of survivals."

"Perhaps you do not understand

Lindoo admitted this. "I have with me their mental leader—the former susceptible Billy Thompson. Perhaps we may get some idea

their psychology,"

Vorgan.

by questioning him."

"Have him brought in." agreed

He pressed a button.

A crack opened in the ceiling, and down from above there dropped a reflection-free sheet of perfect

a reflection-free sheet of perfect glass. It slid in fitted slides, and sealed off the room into two sections.

The section occupied by Lindoo and his emperor was large and roomy, but the other section was small, a sort of cove, off of the main room. A man-at-arms moved an ornate chair that stopped the descent of the glass, and when the sheet of glass reached the floor, men-at-arms went around the edges and sealed it with a gluey mixture that came from portable pressureguns. This was done on both sides, and as those on the small side left the room through the tiny square door, one of them snapped a button on the wall. The invisible and soundless atomizer-vents in the ceiling filled the air with a centle spray of the best bactericide known

entire Solar Sector is composed of forms of life with a bitterly high value of survival factor. That, to coupled with high intelligence, frame on the other side.

to the Loard-yeeh.

of the bactericide, but he grinned at the precautions. He, the vanquished, still held sway over their fears. Thompson advanced and saluted.

Thompson advanced and saluted. Then he waited. "Arrogant, to boot," snapped

Vorgan to Lindoo. His voice came to Billy out of the speaker in the ceiling, and Thompson stifled the natural impulse to face the position from which came the voice. He faced Vorgan.

"Not arrogant," he said quietly.

"I merely request the respect shown to a vanquished, but adequate adversary."

versary."
"Our adversaries are always vanquished," snapped Lindoo. "And "A slave you may consider me," nodded Billy. "That I can not change. But the self-respect I have for having been vanquished only after a hitter fight requires me to consider myself more than a voice-less slave. You can not change that."

Vorgan looked at Lindoo. "Was that your reason for fighting?" asked the Lord of All.

asked the Lord of All, "The basic reason for all strife,"

said Billy, "is to impose your will upon your adversaries." Vorgan and Lindoo nodded impa-

tiently.

"We fought to impose our will upon you. Our will is that we of the Solar Sector gain your respect, slaves though we must be."

"And you were willing to lose eight and one half million men to gain that respect?"

"Your estimate is wrong. We lost but seven thousand souls—five thousand of which were civilians

caught in the backwash and splashover from our fighting." "Seven thous—" exploded Vor-

gan, visibly shaken.

"Seventeen million—" cried Lin-

doo hoarsely.
"Your losses?" asked Billy of

Lindoo.
The Head of Strategy nodded.
"It is deplorable. I am sorry—"
"How date you!" thundered Vor-

gan. "How dare you, a slave, to feel sorry for your masters?" Thompson smiled wanty, "Would

I get better treatment if I claimed to be glad of your losses?"

"I'll have your throat--"
"Careful, Lord of All, you are

' not being fair. I am damned for t being sorry and equally damned if I feel glad. Do you prefer my sympathy or my hatred?"

"You brazen, arrogant—"
"Vorgan, I and all of the Solar
Sector are at your mercy. We
fought you to prove our ability, and

tought you to prove our ability, and be gain your respect. Had we surrendered without a fight, we would have gained your contempt. Also," smiled Thompson, "it is foreign to our psychology to give up easily. But the main reason for fighting was to extract from you a medication of respect. That we have done."

"I know. You are puzzled by my temerity, amused by my position, and completely baffled by my purpose. Were it not so, I would be dead instead of here, behind this protecting glass. For otherwise you wouldn't bother with a race so dangerous to your very lives. Am I correct?"

"You assume-"

"Assume so. And proceed."

"The thing that makes us dangerous to you is the same thing that will make us useful to you."

"A moment. At this point I can

wait no longer," said Lindoc. "Before this bold Terran leads us too far from the subject, I must know: How did you preserve your forces in that bitter fighting where your shins fell like hail?"

"We ran out of ships, not men," smiled Thompson. "We adapted a d phase of the snatcher beam to personnel-protection. Each man carried a focal attractor in his cloth-

ing. Ship-destruction triggered a

fast time-constant multi-driver circuit that inclosed each man in the incompressible spheres of the atomic crusher principle. They were withdrawn from the stricken ship while it was still exploding and brought back safely to a redistributing station where they re-entered the battle in a new ship."

"We'll make a note of that," rumbled Vorgan. Lindoo looked a bit ashamed of himself for not having thought of it before.

"Now, Terran," said Lindoo, "there was talk of a secret weapon. What was it and why was it not

used?" "As a means of destruction," explained Thompson, "nothing of that nature exists. Terra's secret weapon in this case lies within your own minds. We were Gehting for survival, and the retention of our integrity. Our secret weapon is the respect we extracted from you in fighting valuantly and losing pecessarily. Our secret weapon is our minds and our ability to employ logic and data to a problem and come up with an answer. The personnel snatcher is but one phase of this weapon we possess. You admire it. It is, of course, yours by right of conquest. Other developments will be yours, also. But they would be lost if we had been merely trampled over and our interesting facets ignored by the high councils of the Loard-yeeh. You have a borde of problems. Lord of All. A myriad of problems that we of Terra may solve. I offer you the Solar Sector as a research

"You offer?" asked Vorgan, puze zled. "You infer that we have not taken?"

"Permit us our integrity. Sol is our home. Sol is unfit for you, and Terrans are not well liked in your empire because of the living death we carry. Permit us to remain in the Solar Sector and we will be your research area."

"And free to bread discontent?" asked Lindoo.

"Are we fools? Our battle was to impress you with our ability to be recognized as worthy. Another fight would prove our lack of intellectual grasp of the truth. Permit us to live as we were, and you will have all of the herefits of your will-

harsh environment to aid you in your plan. Were you of another psychology, I'd offer alliance, but being what you are I can but offer allegiance."

"Offers?" scorned Vorgan impatiently. "We demand."

"You cannot force mental ac-

tivity," reminded Thompson. "Voc can drive a slave to fetch and carry, to become agricultural, to be menial. But you can never drive a man into sensell activity. The subconscious mind will block. The subconscious mind will divert, and will work against those who drive, and the result will be complete loss of Sol's children and the benefits of a violent heredity. Permit us to remain as we are. Put overseers there, communications offices. We will solve your proleties."

Lindoo whispered to Vorgan for a moment. The Lord of All

area!"

he and the Head of Strategy spoke for an bour while Billy waited in silcuce, wondering what they had in mind. Finally Vorgan turned the communicator on again and sold:

"Terran, it what you say is true, you are correct in your assumption that Sol will be of value as she is. I offer you a chance to prove it. Sscantoo is against all forms of alliance. Sscantoo will ally herself with any other race temporarily to fight us. The entire Galaxy may spring against us if Sscantoo ean not be subdued. We must attack

Sscantoo in the due course of time. "There is one difficulty, however, The Sscantovians are not a pregarious race. Eventually we shall have the same trouble with Secretor as we have had with Tlembo. The eatmen will seek a worthy adversary. and cause us to attack some sector long before our plan calls for it. Your premature battle was but one in several caused by Tlembo, all of

which bring the Loard-vogh out of fine and off balance like a runner careening downbill. Numberless though we may seem, we cannot overrun the Galaxy until our numbers permit it. It must be taken slowly and with definite pattern,

"Now, Terran, we can wait one year before we hit Secuntoo. I'll give you that one year, Terran. In that year, you must devise a means of gathering Secuntoo into the Loard-vogh empire. It must be done without battle. It must be

snapped off the conununicator, and that is expecting too much," smiled the Lord of All nastily, "it must be done without losing more than one hundred men! That does not include Sscantovians, oi course."

"Within one year," said Billy Thompson, "we will hand you Sscantoo as a willing part of the Loard-vogh empire. It will be done without battle, without losing more that one hundred men in the process. What will happen to the Sscantovians I will not presume to care. but I shall destroy as few as possible. During that year, of course, we will be free to work?"

"I will countermand the order displacing all Solar Persons save a small percentage willing to act as data clerks and research coordinators," said Vorgan, "That is

"You will be more than amply repaid." said Thompson. "And one research we will make to provide the Galaxy with adequate protection against visiting Terrans, and protection for those visiting the Solar Sector: That, too, is a prom-

my will."

Within an hour, Thompson was on his way back to Terra. A year, he had. And four months would be gone ere he landed on Terra. and another long period of time would pass before he could get to Sscantoo, All in all, Billy (elt that he had too little time

Yet he smiled. For even in defeat. Terra would not lose her integrity. And how had is slavery when the master prefixes his redone without losing a roon-no. quest with "Please"?

XVIII.

Billy Thompson fretted for four long months in the confines of the returning spacecraft. He was not idle. Daily he spent his time in the communications room, talking and conferring with his laboratory staff on Terra.

The order freeing the Solar Secor of its displacement of peoples took about ten days to clear, and another ten days to settle. It was swift; no Loard-vogh wanted to remain in that section of the Galaxy anyway. And though most of the worlds were cleaning up the shambles of the bitter struggle, the aboratory said and research orsis of the section of the contraction of the conwill. Let the others clean up the meas; it was their job to make the

mess; it was their job to make the cleaning worth while by coming upwith the answer to Billy's problem. For only the right answer would leave Terrans around to inhabit a

cleaned-up Terra. . So Billy fretted because he had to confer by voice alone. It did not matter that the secondary radiation from his subtransmitter, exciting bands in the electromagnetic spectrum pear forty megacycles. would not reach Sol for hundreds of years, and that relative to his ship, the beams were hurled out backwards instead of coming forward toward Sol. But the four months were not entirely wasted. By the time that Billy landed, conferred with Kennebec on the future. discussed the major problem with a few Terran scientists, and then took off and finally arrived at the

stellar laboratory on VanMaanen's Star's only, God-forsaken planet, they knew several hundred things that would not work. Hendricks, the chief of staff.

smiled wearily as Billy entered the safety dome and flipped back his space helmet.

"Hi, Billy. I hope you have a few new ideas."

"Nope. Not right now. I've been busier than the devil for the

been busier than the devil for the past seventy hours."

"So've we, on the last seventeen suggestions. We ran out of ideas

when you ran into Terra. Now what?"

Billy grinned. "I'd like to see the quake area."

Hendricks blinked, blanched briefly, and then smiled wanty. "I thought so. Nothing to see, though, We do have a slow-action movie of the debacle. Reminds me of something out of a superthriller, shot in miniature. We had the sohere beam set up in duplex, one taking power out of the star, supplying the other beam which was clutching about five thousand miles of the star's core. The projectors were anchored to the crust of Brimstone. here, and we started pulling. We pulled like a dentist working on an impacted wisdom tooth. Unlike the dentist, the tooth staved. We broke several beams, each one doing a bit of crust-cracking when the pressure let up. Then we took a big bite and beaved for all we were worth. A slab of crust about seven miles square heaved up, tilted like a

poorly-trimmed raft in a beavy sea-

and slid sidewise into the sems-

plastic inner core of Brimstone." "We can't "I'll bet it was bad, hult?" said Billy,

"We all got away. The planet heaved and gurgled for a week hefore it settled down. But Brimstone is less strained than Terra and avide from a few scattered quakes now and then, she's quiet. Made a mess of that district, though. Horrible roaring, clouds of boiling steam, and all the trimmings out of a 'Birth of Terra'

animated moving picture."
"Try it with an anchor set in
the planet's core?"
"Yesh, but that's too much like
anchoring a towline in a cup of
custard. Too plastic. We might

do it if stars weren't so confounded far apart. Beams get awfully thin on that projection even if we could make it, which I doubt."
"And if we could," said Billy,

"we'd have to wait a few years while the beams got to our stars. They propagate at the speed of light, you know."
"Wonder if we could drop a

beam from close by, go into superdrive and race for the other star,

stretching--"
"What causes the traction?"

"We can't do the Samson Trick," said Billy, "but--" "Samson Trick?"

"Samon Trick!"
"Samon was supposed to have brought the temple down about his brought the temple down about his lars and pulling one against the other. Well, we can't pull one star core against another, but why can't we set up a tripod, anchored in the stellar core, and then use that as a base for hauling with another beam? And feed power for the

gadget from other stellar intake beams right from the star itself."
"In other words a sort of reflex Samson Trick? You make the star pull itself apart, with the aid of mankind and a few thousand years of technical development. I'll have the boys yet to work."

"Did you get any compression?" Hendricks shook his head,

"That was a vain hope. The stellar core is under hard compression already. O.K., Jim. Oh, Hello. Cliff"

"Hi, Billy. So you sold them a bill of goods?"

"Unless we get results. Lanc. it'll be a bill of goods. If we come

through, we're not bad off. Where's your sidekick?"
"Stellor? He'll be along directly. But look, Billy, what do you intend to do with this dingcrank when you get it working? Tear the guts out

of the Sscantovian System?"
"Nope. Just insurance."
"We'll need it." grinned Lane.
"You cut out a large hunk of selling when you ask Lingete and his

gang of rugged, predatory individ-

ualists to form an alliance with the Loard-yogh."

"Trouble is that 'alliance' isn't the right word. I'm offering the grand and glorious opportunity of

becoming willing subjects to the Loand-yorh." Never was a cat that took to being ordered around. Gosh, they're worse than we are. We'll

good. But Sscantovians? Phocoo." "Well," said Billy, "when a lion tamer enters a case full of cats he

gets results. But most of them are well equipped with a revolver, a whip, and a four-legged stool. I'll walk in easily, tell the catmen to be nice, and wave my whin. But the whip has got to be loaded. Linzete wouldn't fall for a bluff. Cats don't. You've got to show 'em the stuff, and then you get your answer. Well, we've a couple of other things to try."

"We aren't licked vet," nodded Cane cheerfully, "But look, Billy, Im still befuddled by Downing's stinking slow, methodical way of doing things. As I get it, Toralen Ki and Hotang Lu told us that we'd all be increased in mental stature

after the Transformation." "Sure. We are."

"I don't notice anything," Thompson grinned, "You won't You never will. No Terran ever will We'll all go on just the same as we were, apparently. It is a Terran characteristic that a personal change always seems to be an opposite change in the rest. We'll all go on as we are and the rest of the Galaxy will appear to get stupider. The change is and bas lavn-and will continue-to be eradual enough so that you will believe that you've always been nossessed of a near-perfect memory. But play chess with your pals, and you find that you are still even because the other guy can lay just as complicated trans as you can with your increased ability to reason. But you see, it is like that old analogy. If the entire Galaxy and everything in it were increased by one hundred times, you would not he able to detect the change. That's

100." "Relativity, speaking," grinned Lane "Classification: Pune. tion. Pun that needs an oxygen

146

teut. Or better, the perpetrator a half-hour immersion in liquid helium," He looked pround and saw Stellor Downing. against the door with a half-amused expression on his line

"Howdedo, A mee job of selling

you did on Vorgan" "Yeah, and a nice pinch he put

"Maybe you shouldn't have nie-

eled him so far." "I was a little rough on him,"

agreed Billy. "But I pushed him right to the limit of my safety. t applied all the traffic will bear. I had to, to show my boldness and to intrigue his fancy, since I knew that in all their victorious twenty thousand years of conquest they had never bit a race that stood up and told him off, face to tace." "You knew what you were doing, as usual," admitted Downing. "But I come to tell you that Hendricks has the tripud beam and the associated junk is set up and ready

It was not too impressive on the surface. Brimstone was cold and forbidding and airless, the only planet to the runaway star known as VanMaanen's Star A uscless system save for experiments of this nature, but excellently adapted for because your yardstick changes, such

for the job of jerking the guts out

of VanMaanen's Star "

The solar intake beams were operating efficiently. The torrents of power they would drag out of the star and use to develop the mithinkable pressures necessary to move the core of the star would come into the acceptor tubes. Foodthick superconductors connected the intake beams to those to be used for the tearing process. And these superconductors were maintained at the temperature of liquid helium by a liquid-cooling system. Liquid helium needed no circulation, since the bact-conducting properties were the bact-conducting properties were to be also according to the properties of the properties were of liquid helium is possible. Normal evaporation from the open baid at one side kept the system cold, all the way throught to the upper-

conductors.
"Good thing they don't have to
use switches or breakers, otherwise

I don't know how they'd handle the energy," said Lane. "A sort of grid-controlled intake-awell stuff. Well, fellers, let's get in the control room and see what gives." Hendricks handed Billy a small chromium-plated case the size of a cigarette pack.

"We're putting personnel snatchers on all of us. If this blows—in fact if the whole planet blows, we all end up a couple of thousand miles in space, all cauned up in incompressible spheres. Safety first,

I say."
"That's how you saved the gang in the earthquake experiment, isn't

"Uh-huh," admitted Hendricks.
"Well, let's take off. We've got
everything nailed down tight."
Hendricks advanced the power.
The meters read up, and the anchoring tractors moved slightly in their

gimbals and became immobile. The projectors forming the tripod of PATTERN FOR CONGEST inflexible beams took up all the remaining slack in the beam system. Not one piece of unprotected matter was left to form a weak link. Beams of sheer energy, efficient to within a fraction of a percent of the Ideal one hundred percent, the Ideal one hundred percent, tem of inflexible energy, driven and maintained by the energy output of a stan-driven to rip the core out of the star like.

The beams thickened as the automatic control advanced in timed steps. Evaporation from the lake of liquid belium increased as the

superconductors warmed slightly from the terrible load. A wrenching—feeling—came to them

A meter indicated that one of the beams—the sphere beam clutching a five thousand mile sphere of stellar center—indicated a movement of point one seven four inches.

The automatic controller went up another stepless interval, and the wrenched—feeling—increased. Through the viewport, the small

flaming disk of VanMaanen's Star blazed at them. It looked as though it were quite ignorant of the cosmic forces that were tearing at its vitals. There was an air of saucy disregard in its placid, immobile bright-

The pressure increased.

"At this point we jerked up a
slab of Brimstone's hard crust,"
remarked Hendricks.

But Brimstone was not in the link. Brimstone was not even present. The inflexible tripod of energy would scorn to move with the planet. The control room and the main development housing connected to the high base of the projector network were depending upon the invisible tripod of energy, deep in space. Brimstone was a large moon, a gibbons last quarter, out through one side window.

The automatic control went higher. And as the pressure increased between the limbs of the tripod, even so increased the power intake from the star itself. Did a star have within it enough

energy to cause its own destruction? They did not find out. The feeling of a wrenching in-

creased, and then leaped into full being. Nauses, sheer instantaneous torture, a pulsed wave of pain, a shattering sensation of intolerable noise, a blinding light that came though the eyes were closed. But these things were merely the physical and mental effects caused

By what?
There had been no grinding crash.
There had been no failure of the

beams.

Yet the meters read zero. Both intake and output. Test power and operation perfect registered on the

operation perfect registered on the string of indicators. Nothing wrong— —but the flaming disk of Van-

--but the flaming disk of Van-Maanen's Star was gone. Something had failed, but it

hadn't been the equipment.

Something had failed, but it hadn't been the star.

And the station and the control room was drifting aimlessly in

144

space. Inspection aboved that no star was close enough to be Van-Manner's Star. There were no stars within a couple of light-years from them. Above their heads, the projectors were follow. The stack gimbals, the tebeams were staking in no power. The lake of helium, a twenty-foot open tath on the roof of the housing, was lying

quiescent.

The entire assembly and assemblage was as it had been before the

Diage was as it had been before the initial surge of power, excepting that Brimstone and his bright primary were nowhere to be seen.

"Well, what happened?" asked

Lane.
"You tell me," Downing said.
"Obviously something gave —

but quick," remarked Billy, "The question is: What could give?" "The star didn't. We weren't on the planet. Whatever gave—we

are a long way from where we started, at any rate." Hendricks scratched his head in puzzlement. "You don't suppose we have gone and warped ourselves right out of

"That sounds like a comic book
plot. I'm not taking any odds-on
bets, though. Have you got an air

condenser and a resistance-capacity bridge? Not the kind that compares a standard condenser against the unknown in terms of the resistance ratio arms, but one of the cheap varieties that merely comagainst the ratio of resistance versus capacitive reactance."

"Uh-huh."
"Is it calibrated to within an inch
of its eyebrows?"

"Vul".
"Well, the dielectric constant of space is calculable. Measure up your air condenser and see if it comes out even. Get the boys to consecute the radiation resistance of this space. It should be three bundered and seventy-seven ohma. That is—If we are still in our original space. Also you might get the microwaye transmission lines. They desend upon the characteristic

impedances of space, the permeability and dielectric constant." "O.K.," smiled Hendricks. "Why the smile, Jim?" "I was merely recalling a story

like this. The hero proved it by determining that Planck's Constant was not the same as back at home. I was wondering how we'd meas-

ure it."
"How did they do it?"

"How did they do it?"
"They didn't you." I like my method better. My measuring the method better. My measuring the method better, but measured to the measured on the resistance type of bridge. Comparing it to a standard condenser would result in both of them shifting at the same time. Whereas the resistance of a metal wouldn't change. That does not seen that the metal wouldn't change. That does not specificate the standard specific the section of space, whereas capacitive reactions does not seen the section.

us "We might measure the speed of light, too."

light, too."
"Not until we get this barge to
the a planet so we can get a decent base

"We're not ill-equipped as all that," objected Hendricks. "This barge, as you call it, is fully composed with drivers."

"Why didn't the snatchers work when we took out after the devil?"

when we took out after the devil?"
asked Lane.
"Nothing blew, in the first place,"
said Thompson. "And in the second place, if we've warped ourselves out of our original space, the
snatchers might have had a tough
time focusing on something lead-

ing out of space through a warp in the continuum."
"Spectral lines do not mean anything in particular," said Downing, who had been peering through a solar spectrometer at some of the nearer stars. "More proof."

"Well, sure. Among items like having a different set of elements and physical laws, the impedance of light, wave length, is a function of that, and so forth. Show me one kinn lying in the field petaling to the angular vector-pattern of this space that agrees with that back means and the rest will probably must his part and we'll be back home.

but displaced by God-knows-what.

"Ralph Welles claims that the
radiation resistance of space is
about two hundred and seventees
ohms," reported Hendricks. "And
Al Forbes reports that the dielectric
constant of space here is about

twenty micromicrofarads per meter less than back home. And the boys in the nicrowave group claim that the quarterwave studies in their pet transmission line demand a new fundamental frequency of operation. CK, fellows. We started to bust up a sun and busted ourselves right out of space and into another. Well, let's find a nice solid planet somewhere and get there so we

have solar power. Then we can start thinking of ways to get back."
"So we couldn't pull the insides out of a sun, even using the sun's own stellar atom factory for power," smiled Thompson, "out we did manage to pull ourselves right out of space. Sort of a case of the

sun pulling first, I guess,"
"Yeah," agreed Lane plaintively.
"But how many different spaces are
there in the common?"

"Probably an infinite number infinitesimally separated," answered Downing.
"In which case," returned Lane,

"how many spaces did we skip between back home and right here?"
"I doubt that the separation beween different space continuums is infinitesimally small," objected Hendricks. "More like a matter of a sort of quanta-separation. If the separation were not reasonably large, the energy necessary to break large, the energy necessary to break through would not be so great. I

through would not be so great. I predict that we are in the space next door to our own."

"And if we take hold of another sun and pull—do we go one more space away or back again?"

"I dunno. There isn't a space-

thing, though. By the time we pull sourselves back and forth a few tt times, we'll know which valve to thold down in order to drive up in-

Billy nodded. "If, as, and when we get back, let's see if we can devise a method of tilting a hunk of stellar center into this space from

vise a method of tifting a hunk of stellar center into this space from there. Better, probably, than just jerking it loose."
"Far better," observed Hendricks

dryly. "If we can tilt ourselves into a new space whilst pulling on a stellar core, obviously it is easier to warp something into a new space than it is to rip the innards out of a star."

"Is this the point to suggest that we have a brand new galaxy to work on ?" suggested Downing. "Nope. We'll tell the Loardvogh about it, though, and they may decide to do something about it."

Perhaps never before has a stranger object traversed interstellar erace. Not by a stretch of the imagination could any race have designed a spacecraft resembling the squat housing adorned above with the battery of projectors. In the first place, it was all wrong for spacecraft design, being built to sit flat on a planet where the normal gravitic urge was down-or rather normal to the flat bottom. Spacecraft are tall, ovoid shells that travel vertically, parallel to their long axis. and the decking extends from side to side, at right angles to the ship's course. And the projectors should not be all on one side. That would leave the strange craft at the mercy.

of an attacking enemy from below. Spacecraft armaments consist of one literes in the top, or nose, one similar turret below, and several at

discrete intervals about the center of the ship for side protection. Of infinitely more trouble than the problem of traversing space in

superdrive with an engineering project instead of a spacecraft was the decision of which way to go. Being lost in the depths of interstellar space without a star map and with no idea of their position.

was no way of determining which of the stars were the closer. The all stood there, twinkling against their background of stellar curtain, and one looked as close as the next. Brightness was no criterion. Deneb, four hundred light-years from -ferm is brighter than Alpha Centaurus, four light-years are light-years around.

Yet, with superdrive, they could cross quite a bit of space in a short time. Utting it off in any direction night bring them to within deciding distance of a star in a short time or it might be that the course went between stars for usual hundred lightween.

It was Hendricks who solved the problem. "Get a hemisphere picture—and we'll superdrive for one bour and take another. Superimposing them one a-top the other should give us a reasonable parallax on the pearer stare. One that

should give us a reasonable parallax on the nearer stars. One that we could see with the raked eye." With the fates obviously laughing up their sleeves, the second plate was never exposed. At fifty-one minutes of superdrive, the stellar

elow. detector indicated stellar radiation t of within one quarter light-year.

Planet-localing plates were exposed as the project swept through the star's neighborhood. There was quite an argument as to which of the seven planets to choose, and for no other reason than sentimenal reasons—and the fact that the physical constants were right for them—the group finally fixed their

desire on the third planet.

The engineering project started to head for Planet III.

and no one to call for a "fix," there
on on way of determining which
of the stars were the closer. They
"I found it? O.K.," grinned

Thompson, "we'll call it Eureka."
"Eureka III?"
"Too cumbersome. Since we'll

possibly not chart the system tet's just call the planet Eureka and forget about the stellar classification."

"Well, Eureka it is."

Jack Rhodes opened the door.

"Better call it Money," he suggested.

"Why?"

"Decause you fellows are going to find out that it is the hardest thing you've ever tried to hold."

"Hult?" asked Hendricks.
"We're right close and there isn't
the faintest shred of gravitic field."

"Oh, no. Newton's Law-"
"Is valid right up to the last decimal place. Every object in the universe attracts—' and we just

"ain't a part of this universe"
"Doesn't seem right."
"May be of exceptionally low

density."
"Must be zero, then," grinned

Rhodes. "And if so, how does it hold itself together?" "You answer that-it's your

ovestion." "How long before landing?" asked Hendricks.

"Half hour, Look, chief, d'ye suppose we might find it to be contraterrene matter?"

"Um. What do you think, Rilly 2" "If the matter here is the same as the matter back home, we'd have a fifty-fifty chance of it being contraterrene. It might even be something that was neither terrene or

contraterrene for all we know." "Interesting possibility.

mean something that is neutrally charged so far as we're concerned. but which in this universe consists of oppositely charged items?" Billy nodded. "We'll find out." "It has atmosphere, and the test

ASTOCADING SCIENCE-FICTION

shell didn't result in a contraterrene indication," called the pilot of the project."

"An atmosphere of what?"
Rhodes grinned. "God-knowswhat," he said. "If Stellor can't make head nor tail out of the spectrograph, the chances are that the atomic stuff here night not jibe

with ours at all."
"There is really no reason for

our planeting at all," said Billy.
"But I'm just curious, that's all."
"We'll be there soon."

The project approached the

planet, and was forced to drive all the way. By the time that they had matched the angular velocity of the planet's rotation, the project was inverted with respect to the surface—though to the men it seemed as if they were driving up to a ground-surface. It gave them an ercie feeling.

"I can see myself visiting a psychiatris by the time we get

T can see myself visiting a psychiatrist by the time we get back." grunted Hendricks. "We're landing—wpword—and I'm getting the screaming terrors already from that feeling of falling upward into the sky."

the sky."

"What you're suffering from is
"What you're suffering from is
the shattering of your basic faith
in the soldity of sold ground, for
marked Billy. "Well, the project
marked Billy. "Well, the project
will land upside down, and we'll
take hold tight with the anchorprojectors. Long enough, the least,
to scrape a sample off of Eureka,
here, to take back and analyze."
"If this whole space is made of
the same stuff, I can see a minor
the same stuff, I can see a minor

metal and stuff for gravity-proof

"Wonder-probably good for something. Wel; we're as close as we can go, all of us standing with our heads pointing at the planet and held to the floor of our project by centrifugal force caused by the planet's rotation. We won't stay long. None of us can stand the

by centrifugal force caused by the planet's rotation. We won't stay long. None of us can stand the mental strain of looking out of the window and seeing solid ground a few feet above our heads and a million million miles of sky to fall down into if we step out of the door. Brezz"

"Close the sun proof shutters and don't look," suggested Billy, "I'm taking a nice large bromide to chili off a few soreaming nerves and then I am going out and take me a shovelful of that dirt and rock up there. Gosh, it's going to feef funny digging doew something that wants rise. Let's make it ouicis."

Billy emerged from the lock completely daid in spacesait. He trook air samples, and then, with the catch-knob between his shoulder blades firmly in the focal sphere of a tractor-pressor beam, Billy was showed up to the surface of the planet. Reaching up over his head, planet with the p

weight.

They never did know whether there were any Eurekans, but if there were, and the Terrans were watched, it was a strange sight they

saw. A sixty-foot rectangular

resting upside down with the planetside to the sky. Projectors duginto the ground, pulled by the anchoring tractors that pulled the upside-down building even tighter to their planet.

From a spacedoor, a pale green beam was fastened to the knob on the creature's back. He was head down, suspended on the beam, and carrying a bucket that must have been filled with antigravity material for the ball was free and the

bucket actually hung upward!
The creature was lowered, still head down, to the surface of Enreka. He reached down below his head and lifted a few stones, dropping them into the bucket, which he held right-side up. Naturally the bucket fromed proposed proposed properly enough to

the ground.

Working by digging down, Billy filled the bucket and was returned down to the door.

"Cut 'em!" he said hoarsely.
They cut the anchors and the
project was thrown from the surface of Eureka by centrifugal force.
And as they left Eureka, and headed
for the Sun, they held a council
and decided that another attempt
—blind though it would be—to warm

space would be in order.

182

"Get every recording gadget we've got on the thing," said Billy. "Maybe we can find out something that will give us a directional trend. And anybody who thinks he won't be struck by lightning if he makes

building of steel, one story high, a prayer, go to it. We could use a

The detectors were set up and the recorders started. The tripod of anchors set themselves in the star's core. The solar intake beams worked well and the torrents of power increased as the automatic control slid up the scale.

"The stuff may be different," observed Hendricks, "but we can still

get power from their stars."
"Darned good thing, too," said
Thompson. "I don't know how else
we'd swing it."

Again came that feeling of wrenching. And it increased as before.

"Does it feel left-handed or righthanded?" asked Lane nervously.
"I don't know and if I did I
wouldn't remember which way it
was the last time." grumbled Down-

ing.

And then the warp formed, and there was the impression, just before it snapped-quick, that the stars in that universe were flowing like apots on a watery surface.

And they emerged into a space completely devoid of anything. Not a star, not a speckle in the complete sohere of utter blackness.

"Obviously went the other way

Jack Rhodes looked up from his calculations. "We had a fifty-fifty chance, according to the Law of Probabilities. But tossing one head does not make the next toss any better thau fifty-fifty chance for tails. In fact," mused Rhodes. "tossing a hundred coins may bring you forty beads and sixty tails-

true chance. Tossing a thousand coins may give you four hundred seventy against five lundred thirty—a three percent error. But though the latter is more to the true division, the numerical devision from zero is only ten in the first case but thirty in the second."

"I hate mathematicians," granted Downing. "They're all pessimists. So the lower we try the more dis-

taut we get, lish?"
"Unless we can get something to

nper the Law of Probability."

"And," added Hendricks sourly,
"something to pull against. This
universe is completely devoid of
anything material."

"Let's put that as a matter of our

being able to detect it at present.
It might be teening with suns indigenous to this universe and completely invisible to us."
"We're wasting time," said
Thompson: "What's with the de-

tectors and recorders?"

"About the only thing I can de-

termine from here is a definite lengthening of the wave length that the puller-sphere propagates on."

"Huh?" asked Billy.
"Definitely."
"When did it lengthen?"

"When did is lengthen?"

"Its wave length increased on an exponential curve to the time of warn..."

"Well, now we know—I think how to get back."

"Instead of pulling, we'll push."

Hendricks shook his head. "I think I get you, but I'm not too

plus or minus ten percent of the certain. Has to do with the wave true chance. Tossing a thousand length-propagation factor, hasn't it?"

"Sure," grinned Billy. "For as refrequency, and a given velocity of propagation, there will be only one possible wave length to suit the conditions. That, essentially means that a given distance will have a definite number of wave lengths so long as the frequency and speed of propagation is maintained. The puller-sphere we were using is

The puller-sphere we were using is propagated on a tractor beam. The characteristics of a tractor beam are that once established, the number of wave lengths between projector and object remain the same. Then the projector presents a leading signal phase, and the phase of the tractor beam most beward the projector beam most beward the projector phase difference. The projector maintains the leading phase all the time, and thus draws the object. It is just like turning a nut on a threaded red, sort of. The wave

length is analogous to the distance between the threads, and the frequency is the number of threads that pass a point when the rod is moved at the velocity of propagation.

"Now, suppose we consider the threaded rod as being fixed as the far end, and pulling at the projector end with sufficient power to stretch the rod. The frequency happens to be definitely fixed by the primary standard in the control rack. The distance between remains the same by the constants set up in the trirood

factor, striving to satisfy the demands of the tractor beam, and maintain the correct number of wave lengths as the beam pulls, will cause the wave length to lengthen. But that tends to change the frequency-velocity factors. Result, if I'm getting obscure again, return to the thread analogy. A standard ten thirty-two screw has thirty-two threads per inch. Stretch it evenly, and disregard the distortion, and you have, say twenty-four threads per inch. Our pulling against the sun resulted in a distortion of the wave length-frequencyvelocity factor, and we pull our-

that fits the increased wave lengthfrequency-velocity argument. "So," concluded Billy, "by pushing instead of pulling, we can cram the wave length down again, and warp space in the other direction. Think ?"

selves into the next notch in soace

"I'll buy it-if you can find something to push against," said Hendricks. "Shucks," grinned Billy. "Shove

out your tripod a short distance, but focus them all together. Then shove against that field of focus," "Said is as good as done," said Hendricks. "Better work, too. Right now it is raining gold coins

and we're wearing a pair of boxing gloves." "And while we're on the way back-I hope-we might consider this: Suppose we take two tractors and face them at one another, hold 'em apart with a trio of pressors, and let the thing go to work. That's

151

providing that we find any use for this subspace stuff. It might-" The wrenching took place at that point. It was much as before: as far as physical evidence went there was no means of telling whether

this again was "up" or "down." There was apparently no drift hetween universes, for their subspace star was not far away.

"This might not be too good," said Billy nervously. "What happens if we land in the middle of a star?"

"We have a far better chance of landing in the royal middle of intergalactic space," observed Hendricks, "We may have been in that position in the sub-subspace. Well, Billy, it is obvious that you hit the right answer. Shall we take hold of

Eureka's sun there and shove?" "Why bother, Let's be independent." Rhodes nodded, "The thing is

still set up." "Well, give it the works," The space warp started again, and again the project was wrenched

through the barrier.

"VanMaanen's Star must be that one back there," observed Hendricks. "Hard to say, but we hit it up about that far to get to Eu-

reka " Rhodes looked up from the sub-"That's them," he said. "And they want to know how in the name of the seven devils we got out here so far in such a short time."

"Short time? Nonsense, They

reka, and Billy spent another half hour digging pay-dirt. After which we raced off for, say a half hour or maybe an hour before we want into space two. Our stay in space two was about fifteen minutes, and the passage through space one was made in less than a minute. Call it a total of three hours."

it a total of three hours."

Rhodes checked his chronometer.
"We've been gone about three hours," he said into the set. The answer came back immediately, for

all to hear. "Like the devil, You've been fifteen minutes since you fastened on to the star and were jerked off of VMS I."
"What's your nay-chronometer

say?" asked Billy.
"Seventoen-forty-three."
"And we left the scene about

seventeen (wenty-eight?"

"Approximately."

"Well, chew this over. Our nay-

chron says twenty fifty-one."
"Suap on the differential timer,"
suggested Hendricks.

Microsecond pulse signals crossed space, both ways. The timer started counting. Three hours and twentythree minutes and eleven seconds went by before the timers stopped. There Hendricks and Thompson

went into another conference.

"We have the following observations regarding subspace: One is
that the matter is unlike Terrene
matter. The other is that there is
a differential in time passage. The
latter may be quite useful. We'll
have the gang check everything possible, of course, and probably even
set up a laboratory in the lower

took us a half hour to land on Eureka, and Billy spent another half hour digging pay-dirt. After which we traced off for, say a half hour or maybe an hour before we went particle in the universe—"

"I don't think Newton was trying to be snobbily semantic," s laughed Hendricks. "Besides, his I Law is a translation from the Latin,

Law is a translation from the Latin, and at that time they weren't even sure of space, let alone subspace and space two, et cetera."
"I've always wondered about the

conservation of energy and the problem of how eravitic attraction couples into that. It could be, of course, that the universal attraction comes from the fact that all the universe was once a single body that exploded because of its own mass-warp. Energy driving the mass apart during the formation of the universe-which is still expanding-and because it took work to separate one body from another. the conservation of energy dictates that they undo that work to get them back together. Since our project was not a part of subspace, no expanding work had been done

on it, and therefore no potential energy had been stored which would be released by gravity taking place." Hendricks smiled. "It's as good a theory as the next," he said. "But is it solving the Sscantovian problem?"

"No, but I have an idea that may. We can set up our warping beam and transfer the resultant forces in the same manner as we transmit other energy. We can't jerk the insides out of a star, nor can we compress the matter there. But there is nothing that says that we cannot change the physical constants prevailing in a certain sphere of influence, and thus warp anything within that sphere into subspace."

"Sounds good. So instead of pulling the middle out of a star we'll just rotate the middle into subspace. Well we have our work out out for us," smiled Hendricks, "I'll get a corps of techs on subspace, and a gang working on the space two. We'll run up a couple of spaces, too, just in case. I'll have a crew on to work on the subspace matter, and we'll eventually have a crew working on admixtures of extra spatial matter with spatial matter. We have enough work for ten lifetimes. Y'know, Billy, I'm going to set a slew of brand-new college kids to tinkering with the subspace problem under the direction of a hand-picked crew of elders. They've got a field that isn't overcrowded, anyway."

Billy scratched his head. "Look, Jim, I have an idea. Superdrive is fine stuff for batting around the Solar Sector, A run of fifty lightyears, though, is a reasonable jaunt, and Secantoo is off about a hundred and fifty light-years. Now if this intend-difference in subspace is workable, we might be able to get to Steantoo in jig time."

Sistanteo in jig time."
"I suppose so. But remember that this jig time you speak of is real time to you. To someone in space, you'll make the hop in record time, but to someone on the ship with you, the same time of a santial trip will ensure."

-

"It's no great advantage as goes time or power," agreed Billy, "but when you're fighting a time limit. as we are, time in this space is what counts and if we have to an into subspace and study until we are a hundred years old before we find the answer to come back with only a year gone, that's it. So see what you can do about tacking a warper into a spaceship, will you? And take another swing at the core of Van Maanen's Star. As soon as you have something, drop everything and bring it to Terra. I've got to get back, but quick."

Horang La's return to Tembo was haifed with silence. It was the silence of defeat, the sympatetic attitude for one who has tried, succeeded in his attempt, acceeded in his attempt, and tound that his attempt taked a vital factor. Hotang La had done his part. It was Terra that failed. Tiembo had guessed wrong. Yet Tembo must try again and and in they became successful. The Little People were tenacious. The Little People were tenacious. The

wanted their liberty, not slavery to the Loard-vogh.

And they would fight to the last Tlemhan for it.

Not for Hotaug Lu were parades and hordes of people to cheer him

and hordes of people to cheer him on his march up the hroad avenue of his home city. He was whisked to the temple of government almost is invisibly, yet the mental rapport of all Tlemhans told them that Hotang Lu had returned—unsuccessfully. Indan Ko, their ruler, save Ho-

tang Lu immediate audience.

plans," said the ruler, "because I tear interception."

"Plans?" asked Hotang Lu bitterly. "With success in our grasp, they throw it away. What more can we get ?"

"Your tone is that of defeat We

must not admit it, even to ourselves"

is doomed."

"Self-delusion," spat Hotang Ln. "Not at all. We know a sethack when we see one. But we must not dwell mon it. lest we become singleminded and believe that our cause

"Is there a better bet in the Gaiaxy than Terra?"

"There must be. Terra seemed a best bet. Yet perhaps their survival factor was so errest that they

Hotang Lu nodded dumbly.

that rational?" "We have Seconton" "But they are almost at the pin-

nacle of their culture," objected the "We cannot energize emissary. their minds."

"Agreed. But they are an ungregarious race. They eling together only because civilization demands tribe-protection. They are fierce fighters. They hate every alien being. They dislike even contact between themselves, yet prefer that to trailic with an alien culture. Go to Secantoo, Hotang Lis, and convince Linzete that his race is in danger of slavery at the hands of the Loard-voob. Tell him, if he does not know already, that the Loard-vogh have conquered Terra. Perhaps Linzete knows what

Terra's secret weapon is. Was it ever disclosed?" "The end came too soon, It was never used. Nor-and I can-

not understand-did I see anything of its manufacture" "Linzete has most of Terra's se-

crets by mutual agreement. Perhans he has also that secret" "Again I fight time," growled

Hotang Lu. "Time-and I feel, the inevitable." "I'd suggest a consultation with

Norvan Ge, the psychiatrist. He will enable you to conquer that defeatist attitude of yours." "I shall see him," said Hotang Lu. "I admit that the shock of be-

ing plunged all the way from almost-certain victory to utter defeat in a few short minutes has shaken my faith in even myself. I shall see him. Then I shall go to Sscan-

too." "Tell me." said Indan Ko. "what was the Terran attitude?"

"They accepted defeat as the inevitable. Their statement was that they fought to gain the respect of the Loard-voeh only; they did not hope to win. This I cannot understand. If you know that you can-

not win, why fight?" Indan Ko shook his head. "It is my belief that they are ra-

tionalizing. No one accepts defeat. They have forced themselves into the belief that since victory is im-

possible for them, they must bow to the Loard-vooth or die." "They may have some deep-

seated purpose."

158

"Name it" "Visit your psychiatrist," smiled

Indan Ko. "Then consider. You were once their mental superior. It is hard to admit inferiority to one that was one time inferior to you. Accept their mental superiority and consider that they may have some

"Plan?" asked Hotane Lu bitterly, "How can they plan? How can they execute any plan? Planning and building is for a free race, without the shackles of an overseer on their people or the restrictions placed upon a servile race. Could they build a modine without the Loard-vogh knowing? Could they hope to instigate an ten thousand year plan of expansion to eventually crowd the Loard-vogh out of the Galaxy?"

"I admit your point. I was hoping against hope. Clutching at straws. Perhaps we should both go to Norvan Ge. Tlembo will stop counting on Terra and fix our hopes on Sscantoo."

"I will be in Secantoo within seven months. It will take that long in constant flight-and with your permission I shall take Norvan Ge with me. In seven months the psychiatrist can aid me and give me the self-confidence neces-

sary to convince Linzete of his danger." "Seven months," muttered Indan Ko, "And I will waser that Vor-

gan has his fleet poised for a blow at Sscantoo right now." "So long as any Tlemban lives."

said Hotang Lu, with a momentary return of his determination, "we will never stop hoping and fighting

to preserve ourselves and all the ASTOUNDING SCIENCE PICTION Galaxy from the conquering hordes of the Loard-vogh. I curse them, their name, and what they repre-

sent."
"I'll join you in that curse."
"They lifted the slender tubes, inhaled deeply, and sipped the fluid, Indan Ko waved Hotang Lu farewell. "Go in haste and good fortune," said the ruler of Tlembo the fourteenth Tlembo since the

start of the Loard-vogh conquest.

XXI.

Vorgan scowled at Lindoo.

"Dead, you say?"

"Starvation."

"Come now," said Vorgan deri-

sively. "Sezare would hardly die of starvation. Assassination, yes. Overandulgence, without a doubt. Even sheer boredom I will admit. But starvation? Never."

"Deny your own medical corps, then."

"I admit it," snapped Vorgan.
"But I am perplexed."

"There were no drugs." "That I know. But look, Lindoo. Sezare was a fool, a stinking voluntuary if ever a Loard-voeh was. As sector overseer his palace rivaled mine. He carried on with a high hand. I recall my last visit. Frankly, I was slightly abashed. If Sezare had not been profitable, I'd have dropped him. He produced, therefore the bush palace and life he led were none of my business. I am not chicken-hearted. Lindon. but to select the favorites of the home race as personal servitors to his own idea of sensuality seemed PATTERN FOR CONGERRY

too self-indulgent. Select his choice, certainly. I can understand that." Vorgan's hard eyes softened at the memory. "But the concept that any that served him were then exalted, and must not be touched by a member of the slave race again—that was fendal."

"How did he enforce that?"
"There was seldom a need, Sezare
was a voluptuary, almost a sadist.
No servitor he ever had lived in
health after the year he demanded.
Broken in mind and in spirit and

Broken in mind and in spirit and in body, they were disposed of as merciful terminations. His final act of vanity was to peacefully end the victim's life, giving the first rest in a year. Starvation, you say?" "Yes."

"Sezare's palace ran red with wine, and the pillars groaned with the richest food that the sector bore. Overindulgence I will understand. Gout, autointoxication, acute alcoholism, drugs, or anything that comes of living in the lush manner. But starquion—how?

"He was in complete starvation. He had dropped from three hundred and seven pounds to a scant sixty-three. He had locked himself in his suite and was constantly under the influence of a machine devised by . . . by—"
"Oho!" exploded Vorean. "A

machine! Devised by—?"

"A Terran."

"A Terran! Is he here?"

"Yes-he and his machine. Partially destroyed," "Why?"

"Terror."
"Bring in the Terran. I'll see

him. And if he cannot explain to perfection, I'll see him burn!"

The prisoner entered. No glass separated them, for the Terran was sterile. He was forced to his knees, but if terror wracked the man, it was not evident.

"Your name?" thundered Vor-

"Edward Lincoln."
"Your trade?"

"Technician. Research co-ordinator for His Exalted Highness, Sezare."
"Sezare died of starvation."

"I know-it was deplorable. I fear that I was his unwitting mur-

"You admit it?"
"I must. It is true. Had I but

"Explain. Your life depends upon it."
"Sexare the Exalted directed me to devise for him a means of gaining greater sensual stimuli. Apparently the law of diminishing returns—you permit my personal opinions and observations?

"Proceed. As you will."
Lindoo nodded and whispered:
"His observations are a measure of
his attitude. It is his attitude that
will save or kill him, not his words."
The technician continued. "Seare
had indulged himself in every sensual manner. He was constantly on
the search for something new,

The technician continued. "Seare had indulged himself in every sensual manner. He was constantly on the search for something mes something more searing, something more thrilling. He directed me to devise some means of satisfying his demand for greater pleasure. That was most difficult Lard of All, for

Sezare had the entire resources of a galactic sector to provide his voluptuous demands.

"I succeeded in devising a ma-

chine that would give him dreams as he slept. Then, you see, when askep he could indulge in his sensures. That removed the necessity of stopping his round of pleasure to gain needed sleep; his round of linsh living could go on continuously. I requisitioned the finest of artists, writers, and weavers of song to record the pleasures

er's of long to record to pleasures of the from the most ferrile tange, and the first tange of the first tan

"I overbooked the fact that Sezare might find more pleasure in sleeping and dreaming than he would in waking and doing. He closeted himself with the machine. I . . . was nearly destroyed because I breached his chamber and tried to turn the machine off."

"True?" asked Vorgan. "True." nodded Lindoo.

"Overdid it? How?"

"He spent all of his time under the influence of the dream machine," said Lirsoln plaintively. "He ing staff, and he scourged the collectors of his-women. None of them could provide for his pleasmer like the machine. He retired to it, and in his strange acceptance of its pleasures, came to feel that sleep, moder the machine, was real, whereas life, with its disappointments, must be skeep with bad dreams. Since the dream machine could provide only dream food. Searne starved—his body starved,

"Continue."

"Continue? There is no more.

I had been trying to turn off the machine for weeks. I was denied, even threatened. Finally imprisoned so that I could not appeal for help. Sezar died, and I was sent here. In terror that some other of the Loard-vogh might fall victim, I have ruined the machine, and I shall die before I rebuild it. It

... is worse ... than the most entangling of drugs."
"Dismissed," said Vorgan dryly. The technician was led away, not guilty.

"Lindoo, what of Sezare's sector?"

"In charge of Sezare's underling, Narolla. Narolla has full control and he is competent. Narolla is uot a voluptuary; he has seen too much of the dissolution of Sezare. And, Vorgan, it may be interesting to note that Narolla's productive output has increased."

"Already?"

"Sezare has been on the trail of starvation for weeks. Narolla took charge as of Sezare's withdrawal

into dream-sechision. Regardless of the Terran's act, or motive, the Loard-vogh benefits by the change." "I agree. That is why I freed

him."
"I am beginning to feel that Terrans can be trusted," said Lindoo.
"It all depends. It will not do

"It all depends. It will not do
to trust them too far in spite of
their apparent willingness to belp.
Until we can be sure, we must be
wary. Thompson's success in seliing an antisocial culture on the
proposition of complete co-operation will go a long war—if he sure

"We could, perhaps, harden his job," observed Lindoo. "Suppose we let Secantoo know that the integrity of Terra depends noon Secantoo's acceptance of defeat without resistance?"

coods."

Vorgan laughed cheerfully.

"Terra would not be liked in Sacantoo. No man can do anything but hate another man who is willing to sacrifice a former ally for his own skin. Under the face of that, if Terra can sell her bill of goods.

she would certainly be working for her integrity."
"Well?"
"Relax," laughed Vorgan. "I

"Reax," saughed vorgan. ')
happen to have one thuy bit of information that you have not. Hotang Lu went to Secantoo as a last
resort. He hopes to stir up (rouble for us."

"I think you should erect that

statue to the dishonor of Mangare He should have destroyed Tlembo."

f "He should have—and I shall bave to. It seems to me that the proper plan of action is to find the present Tlembo and get the little men in line before we take on anything else."

Indan Ko, the ruler of the fourteenth Tlembo since the Loard-rogh conquest blinked in amazement as the aide announced the formal visitor. "Thompson, the Terran?" he asked in surprise. "He who spat upon our future? What can

he want with me?" Billy Thompson entered the reception room uncomfortably. Indan Ko's presidential residence was built on a slightly more heroic mold than the normal housing plan of Tlembo, but still it left much to be desired. Tlembans stood an average of thirty-four inches high, and their lives and edifices were built upon that proportion. A Tlemban ceiling proportional to a comfortable ten-foot six Terran ceiling gave five feet three inches of clearance. That missed Billy Thompson's altitude by exactly ten inches. The formal residence of the ruler of Tlembo was of palatial build. with full seven-foot ceilings. It cleared the top of Billy's head by

eleven inches.

An excellent building in which
to contract claustrophobia.

And so Billy waited in the recep-

tion room uncomfortably. A large room to Tlemban thinking, its dimensions were proportionally small, and the thirty by forty feet —Tlemban—shrunk to fifteen by twenty, Terran.

The formal "court" was of more ample proportions. The proscenium arched forty feet high and the entire room was a full hundred feet in diameter. A vast room to Themban standards, but not much larger than a very tiny theater to the bulking Terran that had tripped over a table in one of the minute corridors.

Billy had been equally hard on the ceiling fixtures, and the doors had been somewhat of a pinch, too. But he was now in where he could take a full breath without fracturing the plaster on both sides of the room, and he took one, in relief. He felt very much like making a few pleasantries about his difficul-

ties, but he realized that the little man on the dais before him would not appreciate any inference to size. So Billy merely saluted formally and waited for the tiny monarch

to speak first.
"You are Billy Thompson of Terra."
"I am."

"You are the man who directed the Battle for Sol?" "I am." "And the man responsible for the

destruction of all hope for civilization."
"That I deny."

"You refused to use your secret weapon."
"It is that factor that I am here about," said Billy. "But first I wish to reach an agreement with

y you."

"An agreement? What agreement can we possibly reach? Tlembo has devoted her life to the job of e stopping the Loard-vogh. Terra, when she had victory within her I power, threw it away."

"I have come to tell you that Tlembo has failed in her mission in life. That Tlembo will always fail. That Tlembo will be better off if she recognizes that fact and

accepts the inevitable,", "Get out!" snapped Indan Ko. "You dare to force yourself into

tuy presence and insult me!" "Before you make any rash motions," said Billy calmly, "such as having me shot on sight-yes. I perceive the modine-ports in the walls- I wish to warn you and all of Tlembo that primates are gregarious and resent the destruction of one of their band. Kill me and Terra will descend in all of her power. We, who you claim could have been victorious over the Loard-vogh will find little difficulty

in wiping Tlembo right out of the universe itself!" "Providing that you have the support of your fellows-those

have betrayed. Will those you failed now come to your rescue?" "Hotane Lu is quite familiar with the Terran action," said Billy, "Did he report one single cryfrom any Terran-for me to or-

der retaliation?" "You claim that the entire Solar Sector was in agreement with your

surrender-noticy?" "I do."

"Then I understand our defeat, Terra has not the honor nor the willingness to fight for the freedom that is her right."

"Terra retains her integrity." "At the will of a conquering race."

"We are leaving the subject," said Billy. "I made a statement to the fact that Tlembo has failed and will never be able to do otherwise. You are the one that can not face facts. Indan Ko."

"We shall fight to the last." "To the last gullible alien," snapped Thompson. "Indan Ko,

how can you possibly delude yourself into the belief that you will some day be victorious?"

"Because it is our belief that slavery and conquest are evil. And I define 'evil' as any factor working against the advance of civilization."

"Can you view both sides of a personal question dispassionately?" "I have that belief." "Then view the Loard-vogh dis-

passionately. Civilization throughout the Galaxy will be nothing unless the worlds are united Stellar empires, discreet and belligerent, will result in chaos. Sectors whom your defeatist practice must such as Terra controlled would be embattled against sectors such as Secantoo controls, and there would be a never-ending flurry of pacts and agreements and aggressions between one sector and others, against

still others. That is chaos, Indan Ko." "Perhaps you are right. But is the right to rule because of might a

proper answer?"

"No. It is not. But I want you to understand that the Loard-vogh mental strategy is entirely selfish. The only thing that kent the Loardyork from sweeping through the

cannot conquer and hold any system until there are enough of them to control it. They expand through the Galaxy in direct proportion to their birth rate. Since they enslave those systems commerced, and become high lords of creation in their conquered territory, there is nothing for them to do except procreate. The factors that inhibit racial expansion on any democratic world are numerous, but most of them stem from financial insecurity. Since the Loard-vogh have no financial insecurity, and a family with a borde of children are as well educated, well fed, and well clothed as a family with none, why not? Especially when there are slaves to tend and care, feed and provide-The system has its advantages, Indan Ko, which I am pointing out to you. Its disadvantages are also there, too. Those we know. They include lack of personal responsibility and a complete and utter disregard of the rights of another

regard of the rights of another race to live as it wishes to live."
"Granted. But where is this leading us?"
"Merely to the acceptance of

the statement that the Galaxy must be united. The Loard-vogta nutriting the Galaxy, and as such are doing the right thing. They are going about it in a rough-shod manner, but it is far swifter than the treaty-join-and-wangle method. The Galaxy must be united!"

treaty - join - and - wrangle method.
The Galaxy must be united!"
"Go on. I accept that but reject
the Loard-vogh as racial saviors."
"My visit with you, Indan Ko, is

you are doing harm to the Galaxy."
 "A matter of opinion," snapped
 the little man

"Perhaps. You've heard my statements to Hotang Lu. Were it not for Tlembo, we would have lived in cheerful ignorance for another three thousand years. Now, because of you, we are awakened, with terrific responsibility, and must forever work like slaves to maintain that which we did not need before. You will continue, you swear. That means that Tlembo will go back and forth through the Galaxy, always hiding, always keeping ahead of the Loardyorh conquested areas, and always seeking a race of ability, power, and freedom. Again and again you will find them. And again and again you will set them to fighting the Loard-yogh. And yet, to the Loard-vogh, you are nothing more than a gnat, whipping madly about the ears of a mastodon. Annoving but far from dangerous. How do you hope to win with such a plan?"

"We will find a race with sufficient power—"
"And when that race has the sufficient intelligence, that same race will understand the true worth of

conquest. Terra was no real menace."

"The Loard-vogh thought so."

"The Loard-vogh were ignorant

of our intellect. And," smiled the Terran cheerfully, "they were forced to collect us. Terra, in a long-time fight, could have bearen

them."

Indan Ko scowled and thought for a moment. This huge Terran that crowded his palace like a giant

that crowded his palace like a grant in a doll's house was not making sense.

"I do not understand."

"Terra is known as the Planet of Terror," said Billy, "because of the evolutionary system caused by the hard radiation in that district. You have seen the viciousness of

You have seen the victousness of our fire tested, could be not rungus, our micro-organisms, of our life steelf. Could the Lond-type stand up greater, of lungus spores so tenacious that they grow on synthetic results? Steller Downing held a Sicantovian guines pig in one hand for a moment and it died a most herrible death within minutes because of lung that were incouous to him. In my ship there stated, and what Terrans call quiet high because it is growing a full beard of midd. Could you—or the beard of midd. Could you—or the

Loard-vogh—spread it on a slice of bread and eat it with impunity?"
"Definitely not."
"Seventeen million of the Loardvogh died in the Battle of Sol, and more than half of them perished because Terrau spores crept into chinks in their space armor. Chinks so small that they do not permit

loss of air in space.
"You see, Indan Ko, the fear of
Terra that drove the Loard-vogh
frantic was because they thought
that Terra would send out myriad
after myriad of tiny spacecraft,
loaded to the bomb bay doors with

105

minute spore bombs. That we could have done. But we did not."

"That was your secret weapon?"
Billy shook his head, "Terra's
secret weapon is her ability to grasp
opportunity. Which brings me to
the point of this interview. The
Loard-vogh have a twenty-thousand
year plan of conquest. No race can

hope to stop them alone. No race in the course of a year, a hundred years, or even a thousand years could hope to defeat them alone."

"Terra could."
"That is not defeat. That is ex-

termination."

"The Loard-vogh should be exterminated!" Thundéred Indan Ko. The little man's thunder was slightly high-pitched to the Terran and not at all awe-inspiring. Billy merely

smiled.
"It is not for any race to render sterile of life one quarter of the Galaxy. Extermination is not victory. War by proper definition is a measure used to impose your will upon a noncooperative government. Even the Loard-vogh understand

upon a noncooperative government. Even the Lozard-vogh understand that a dead slave is no good. Rx-Tentahn, but you will fail in your compuest. Therefore I ask that you will fail in your compuest. Therefore I ask that you will see that the proper operation of the proper operation of the proper operation. The therefore I ask that you will be a bushand your strength. Roll with the punches. Take them easy. Wait until you are set and see the proper opening, and then come strike, and lake the double-

game. Use your diplomatic ability."

"You plan a long-time retalia-

tion?" "Our plans are nebulous at present Terra fought for one thing slone and that was to eain the respect of a race that less only contempt for those that how their heads willingly. Had we invited them in instead of fighting, they would have suspected foul play. We fought hard enough to convince them that we meant business. After all, our planetary heritage is such that we would be out of character if we gave in without a fight. Ergo we fought.

"Tlembo," went on Billy quietly, "has been frantic so long that she has lost perspective. That I claim. and it is deplorable, but not so damaging as to lose hope of repairing. Tlembo has been nicked amin and again in her effort to find a savior. Her continued defeats have made her bitter, and ever more determined to win via the crushing defeat route. Consider this, Indan Ko, and then tell me if you think you are right in continuing to bring minor factors to bear against the Loard-yeeh."

"And what would you suggest that we do?"

"Go to Vorgan. Ask immunity and audience. Vorgan is not without honor. He will respect your request for immunity. Then tell Vorenn that you fear the strength of his fighting forces, and that you will cease your constant effort to undermine the Loard-voch. Tell him that Tlembo has certain factors that will enhance the Loard-voeb

culture-you and he know what they are, as I do-and offer him those factors in exchange for Tlemban integrity."

"I dislike it "

"Naturally. But look, Indan Ko. You will be taxed terribly. You will be forced into handing over a certain percentage of your wealth. You will work for them, and for little remuneration. Yet your hardships will actually be less than the cost of fighting them. Now you must maintain a fleet, arm your cities against invasion, and always prepare for war. If you submit to the Loard-york banner you will be protected by the Loard-work and may Heaven belo say race that attacks Tlembo? The income you spend in being a nominal slave will be less than the amount speut in being an armed free-world."

"And eventual conquest?"

"Console yourselves with the certain knowledge that your hardships will all be avenged sometime. Not in your life, perhaps, but in the time of your descendants. Submit to their hard, exacting rules in outward abjection, but keep your mind forever on the future, when it will no longer prevail. And as you go. and as you find other races that are suitable, send their representatives to Terra. Terra will be the mastercontrol of the auti-Loard-york com-

hine " "I shall think it over and discuss

it with the Tlemban council. But what of Secanton?" "Linzete must understand, also,"

"But Hotang La is there now." "What! Filling Linzete full of the theory of bombing the Loardvogh with Solar spores?" Inden Ko nodded

"Then I must go-and quickly?" "Your trip will take months," objected Indan Ko. "Meanwhile, Linzete may set his machinery in

operation." "Contact him," said Billy. "And have him smooth it down a hit My trip will not take months. I'll be

there in days" "Days!"

"Yes. We have a new mode of space travel. It will be yours as soon as you decide to join the

Loard-vogh-" "Terran, it sounds as though you were beloing them." "Naturally it does. Until we are

ready to strike, we must aid them completely-and always remember that what we find and give them we will have ourselves. No single weapon won a war, Indan Ko. But if we can match them man for man we will win because our wits are

sharper. Now I must waste no time in cetting to Secantoo." Billy's exodus from the Tlemban capitol building was more arduous than his entry. This time he was in a hurry, and moving swiftly through corridors too small for him. brushing doll-sized furniture with his mass, and crusbing not a few of the smaller and more fragile pieces in his haste-to say nothing of squeezing two doors from their hinges in his passage—they all hampered him. Tlembo was going to

nay well for this visit. Outside. Billy towered above the

100

Tlembans as he strode up the middle of the street, his head not more than a few inches below the trolley wire that fed the street car system. Traffic policemen gave him passage. for he could be seen for blocks. He turned into the stocepart and entered his ship.

He was met by Cliff Lane. "How'd it so?"

"I think we got him. There'll be no more trouble from that sector." "Good Now what?"

"We whip this horse into action and head for Sscantoo. On the triple. Flotong Lu is there telling Linzete of his danger and urging

him to get set for conquest." "Lingete is going to be a tougher nut to cruck," observed Lane. "Well, let's get going. I've a few

items to tell about Hendrick's researches in subspace matter." Thompson's ship rose sharply, plunged into space, and then the

distorting beam in the control money started to function. "Think you can bit Sscantoo?"

naked Billy. "Breeze," smiled the pilot. "But look, Tony, that's a long

way off." "So's Terra," answered Tony laconically. "We hit Tlembo all

right, didn't we?" "O.K., you're the pilot. Drop me on Secantoo, and I'll invite you

to a drink." "A deal," grinned Tony. A moment later the pressure was built up, and the ship was wrenched into subspace. Then began the long, long journey to Sscantoo which ASTOUNDING SCIENCE PICTION

would take less than a few days in

the universe from which they came.
"Now," said Thompson to Lane.
"what's with Hendricks and his researches?"

"So far, subspace matter is enigmatic. It does not combine atomically or chemically with normal matter. It shows other physical properties, however. They separated the sample by the ancient method of using the various melting points and specific masses. The stuff has no gravitic attraction, but it has mass, you know, and they used a centrifuge on it. They got two kinds of matter. One we'll call metal for the simple reason that it conducts electricity. The others are nonmetals because they do not conduct electricity. There was a small quantity of a light blue gas that was occluded in the dirt, it boiled off

early and they caught it. Well, if nothing else, it will come in handy for surgeor's tools, chemical hardware, and the like, since you can put anything into it and it will not dissolve or go into chemical combinations. I bechaw got something to hold the Universal Solvent."
"Yeah," grimed Billy, "Takes

"Yeah," grinned Billy. "Takes something strictly out of this world to do it, though."
"Since there's no weight to it, the

stuff still leads for the roof. The gas, they say, boiled off down, since the vapor pressure and stumopheric brownian movement drove it that way. Good stuff for antibends atmospheres, I'd say. Mix it with twenty percent oxygen and breathe it. It will not dissolve, at least no detectable loss is noticed with the instruments that Hendricks has."

"There's a brand new system of chemistry, nuclear physics, and garden-variety physics out there," said Billy. "We've opened up a new field, or maybe two. Well. we've got several months here. Let's get to work.

Vorgan, Lord of All, smiled in a puzzled manner. "You have my tword," he said. "Your immunity is granted. Complete and absolute it immunity, with the right to speak as you wish without fear of returns."

Indan Ko shifted nervously. He felt a great uncomfortable fear of this vast room, that seemed to stretch endlessly. The dais upon which Vorgan sat was like a mountain to the little man, and each step was knee-high to Indan Ko.

ADDRESS STATE....

"Tlembo is weary," said Indan Ko. "Yet we are bitterly afraid."

"Of what?"
"Slavery."
Vorgan shrugged. "It will come

"Lord of All, may I offer you a

bargain?"
"Bargain?" grunted Vorgan.
"Tlembo has been a source of discomfort to you. We have forced you off-balance several times, have

caused you to go forth and fight in sectors where you were not ready to enter. We have been instrumental in causing you to change your

master plan."
"Right."

"We have never been a real menace to you," went on the little man, "but we have been annoying. Now if I offer you our promise not to stir up any more trouble, will you offer us less than utter and abject slavery?"

Vorgan blinked. The bluntness of the offer was startling to him, and the offer itself was a new facet to the Leard-roop conquest to the Leard-roop conquest coursing the long-dead Lord of All that had permitted the initial escape of the Tembass. But startling at a fead man's mistake was not solving this problem, and Vorgan dropped it to consider Indan Ko's sartline offer.

startling ofter.

Until recently, nothing like this could have come up. Save for three or four times in the past—before Vorgan's time—when Tiemho had created minor riots, the Loard-vogh conquest had been lightning fast and completely unheralded. A see-

tor would be overrun, a star cluster at a time, and no word would go out ahead of their plans. Races fell before their might, and then lived in slavery. A slave has no position, and no right nor ability to offer terms. Therefore terms were a consideration never before handled.

Terms, by themselves, offered a conflict in Vorgan's mind. Bartering and buying among the Loardvogh was normal, of course, but the

concept of terms from an alien race struck a snag, somehow. Yet Vorgan could see the point. A chance for the Loard-vogh to complete their master plan without

complete their master plan without the interference of this race of trouble-makers. True, the Loardvogh must relinquish the right to hold them as absolute slaves. Perhaps a single representative in the Lower Council would saffice. At any rate, giving a little right now might mean less loss for the future. Vorgan groaned at the thought of all the races of the Golasty saking

terms, and getting certain conditions of servitude. Better to give a little to this one race than to go on trying to keep a galaxy full of races satisfied. No, he thought, not one race. That makes two! Terra lad certain advantages asked and offered.

I makes two! Ferra had certain advantages asked and offered.
But Terra had been defeated, and
only her very brilliant ability had
won her the right to a certain freedom. And, of course, Terrans were
belping the Loard-voglo on a myriad
of planets, doing things that the
Loard-vogle (ound difficult, men-

But to keep Tlembo from stirring up trouble might well be worth the effort. Tlembans were not the intelligent race that the Terrans were,

but_ Vorgan laughed. Let the Terrans have another job. They could possibly use the Tlembans in some way. Let Terra keep Tlembo satisfied and quiet and useful! Terrans were of exceedingly high intelligence, and the results of their researches often required either that the Terrans follow it, or that the Terrans direct a number of Loard-yogh. The latter was not right, politically, and

it had been a bother to them all. To have a large group of Terrans all running down important details seemed better, though Vorgan admitted that it was a waste of good brainpower to have highly trained technicians performing routine research. Tlembans were of a high order of intelligence, though not as high as the Loard-vogh. They might be able to handle the routine experiments and act in tertiary

capacities under Terran direction. "Indan Ko, I offer you a brief period of armistice. Permit me to consult the Grand Council. I-" Lindoo entered, hurriedly, "Lord

An excellent idea

of All. Borgara's machine is here!" "Indan Ko, I must see this immediately. Consider the armistice while I am gone, and rest assured that I am about convinced that we can come to terms. I shall return directly."

Vorgan followed Lindoo into the large antercom that opened on the PATTERN FOR CONQUEST

paye of the reception room. There were six of the Loard-vogh Grand Council there, grouped around a machine of amazing complexity. It was more amazing because it did not appear to make good sense. Vorcan thought that perhaps it would make sense after it started to run.

And the thing that made Vorgan catch his breath was the Terran sitting in the corner with folded arms.

"Well," said Vorgan shortly, "what does it do?" Lindoo stepped forward and

snapped the switch on the base. The Terran leaped to his feet and

snapped it off. "Don't!" he warned "That was a rash thing to do,"

snapped Vorgan. "I may be rash," admitted the Terran. "But lese majesty is per-

missible when a life is in danger." "Lindoo, give me the details. "Borgara went crazy." "Crazy? How?"

"I don't know. But it was tied on in this machine, somehow," Vorgan turned to the Terran. "Every time we have something out of line going on here, we find

Terra mixed in it. What is your name, Terran?" "Edward Atkins."

"Position, Atkins?" "Technician."

"And what is this machine?" "A device I made at Borgara's direction "

"Borgara went crazy. Why?" "Because he used this machine. I insist that it remain dormant. Otherwise the rest of you will be that befell Boreara the Powerful." "No doubt deplorable," observed

Vorgan dryly-"Ouite. I did his bidding, and he became enmeshed in it."

"I'm not too surprised," snapped Vorgan. "So give me your side of the details. About one more like

this and I am going to wipe Terra "Forgive me if I seem to slur u member of your race," said Atkins carnestly, "but Borgara was a bitter tyrant. He held his rule by sheer force and violence. He maintained his productive output by torture. He cared little for pleasure or ease, and he drove the people in his sector unmercifully. On one planet, Borgara set up a rule that any man who did not produce a given amount

would find one member of his family entering the Grand Torture Chamber. Torture threats against a person are far less demanding then threats against a member of the immediate family, And, Lord of All, he set the minimum limit slightly above the average output.

and kept it rising. "Borgara found his pleasure in watching people in torture. The trouble was that the more satisfying kind of torture didn't leave a victim alive too long. So Borgara directed me to devise a means of torture that would be most terrible and yet would not kill too soon. I

did and it is this machine " "Yet it drove Borgara insane." "Correct. Permit me to remove

a few important parts?" "To demonstrate without danver?"

170

WVer " Atkins stepped forward and removed two tiny wheels and a glis-

tening sphere. "Now start it," he said. "The danger is gone."

Lindoo suapped the switch again. The myriad of levers began to reciprocate. Tiny flashing wheels started to turn and noncils of light flickered through the facets of the rotating spheres. It was a fascinating machine, utterly fascinating. It increased in speed, and the flickering, flashing, interwoven motion flowed with a noiseless violence. In and out, through and through in a mad nattern went the parts. And as they watched it the machine lost its mechanical shape, apparently, and became an almost living thing

that breathed and was-shapeless.

The individual motions became one master writhing. And the Loard-vegh stared at the machine with horror on their faces. There was sheer and utter horror there, but they could not move away, nor could they speak. They began to writte a bit, as something in their mental attitude caused the orset of physical pain, and the

writhing grew more violent, Atkins stenned forward and

turned the machine off. Vorgan stormed.

"I thought there was no danger!" be shouted, rubbing a muscle that had cramped "No danger," said the Terran

with a faint smile. "You see, when I removed these parts I protected myself so that I could turn the ma-

chine off before it became really

AMBROUNDING COLUMNS DIGHTON

dangerous to you. I wanted you to see and feel for yourselves just what Borgara thought excellent." "But we were going insane and

were aware of it!"
"As a means of torture, can you

"As a means of forture, can you think of any better?" asked Atkins. "To sit there, watching the machine, knowing that it is driving you insane, and that the machine is causing you physical pain, and that there is nothing that you can do about either—that, Lord of All, is the supreme torture."

"And Borgara got caught, is that it?"

"Unfortunately for Borgara, be used it once to often. He got tired of watching the victim, and watched the machine. Since he was alone in the torture clamber, it—got him. I beg of you, destroy it. I'd not care to be responsible for more trouble."

Lindoo opened a drawer in the

chest, took out a high-power modine, and blasted the machine to ribbons. "Atkins, too?" Vorgan shook his head. "He was

only doing what he was told. Borgara's Sector is in good hands, they tell me, and the new overseer has released forty million fighting men that Borgara needed to control his sector. No, I think . . . dismissed, Atkins . . . that once again the Terrans have done us a favor."

Vorgan returned to Indan Ko. "Tlemban, tell me something. Was Terra behind your decision?"

"Yes," admitted Indan Ko.
"Terra pointed out that the Galaxy
must be united and that the LoardPATTERN FOR CONSUEST

vogh were doing just that. Terra does not grant that the means you are using are correct to their ideals, but they admit that you are doing it quickly and efficiently. And they point out that we can never hope to win, ergo we should make the best of theirs! So..."

of defeat. So—"

Vorgan groaned. "Terra—what

And then he straightened his face again, and said: "Your terms are granted. Your instructions are to report to Terra as assistant operators. Your immunity becomes eter-

is maintained as well as it can be when you are taking orders from Terra. And," he smiled, "perhaps it will keep Terra out of my bair."

XXIII.

Billy Thompson faced the catman in spite of Linzete's hiss of disapproval "I know of our danger," snapped

the ruler of Sscantoo. "Few know it better than I. I was on Terra just before trouble struck, and I know and appreciate the mass against me. And you tell me to submit willingly." "Might as well," said Billy. "It's

inevitable." "Sscantoo has one chance," said Linzete, "And that is to use

Terra's secret weapon." "You haven't got it," said Billy flatly. "And if you mean sporehombing, don't be an idiot." "Idiot?" snarled Linzete. "Better an idiot than a turncoat that is

now fighting his conquerors' battles for them. You commanded a certain amount of respect, Thompson. But that debt was canceled on the day that you started to curry favor. Go back and fawn upon the Loardvogh; do you think that I don't know what's in your mind? You'll willingly sell Sscantoo into slavery in order to gain a little more voice in your plaintive wailing cry to 41_2 "As you sold Tlembo to the

Loard-vogh."

"I've sold no-"

nal, Indan Ko, and your interrity "Where have you been?" snarled Liprete

"Coming from Tlembo," admitted Billy with a laugh, "And there has been no communication because we have been traveling in subspace. It took us four days to cross space from Tlembo to here. We've been out of touch with the Universe for

months, as far as we're concerned. Now if Tlembo is being sold, I don't know about it." "Hotang Lu left three days ago because he was withdown His

statement was that Indan Ko was taking the trip to Vorgan's capitol in order to offer terms of surrender. Explain that!"

"Indan Ko was intelligent enough to understand the implications behind fighting. Look, Linzete, I sold Tlembo a theory of operations, You cannot hope to win alone."

"We can exterminate them." "And in doing so, render unfit for life a quarter of the Galaxy? That I will not permit. And, Linzete, any extermination you perform will be strictly post-mortem. Granted that you have the ships and the men and the spores all grown or collected and packed into bombs. From a single bombing of a Loard-vogh planet to extermination of life on that planet will be a matter of six months to a year. Meanwhile, the Loard-vogh will have attacked and conquered you. Think Terra didn't think of it? We did and we considered it well. But Linzete, we like to remain alive,

We destroyed seventeen million of

the first-line fighting men. That was war, and the men were expend-

ASTOUNDING SCIENCE-FICTION

able. A nice nasty term. Terra lost seven thousand because Terra does not consider any man really expendable. The situation is about even. But consider their utter batred and violence to find a single planet hombed into lifelessness ever afterwards by filling it with sheer death-rot."

"I see the point, but if we're to lose, let's lose honorably, die fighting, and take as many with us as

we can." "A poor attitude, You must fight to win and to live Linzete. War is a means of forcing your will upon an enemy, Linzete. That means there are a number of different kinds of war. War per se is usually the last resort. There are social wars and economic wars, and ocople do not consider them too violent. But a shooting war gets everybody all worked up.

"There has been a lot of talk about Terra's secret weapon, Linzete. It has been explained again and again. Terra's secret weapon is the intelligences to recognize fact. even though obscured. If you had your choice. Linzete, which would you rather be, the nominal ruler of a sector or the man whose advice

is taken on every decision-who in fact tells the ruler what to do?" "Lacking the right to be both acknowledged ruler and factual ruler, I- That is a problem that

has never occurred to me" Billy said, very patiently, "Terra knows. Terra will win this war. decisions from our advice. As such we have the rule of the Galaxy. I tell you this because Secantoo has too much to gain by absolute co-operation with Terra. Eventually the Loard-vogh will be seeking our advice. I have sent them Indan Ko, the ruler of a race that has caused them no end of tross-

ble. Indan Ko will not arrive there for months, yet I can predict that Vorgan and Lindoo will place the Tlembans directly under Terran supervision for divers reasons, not the least of which is the fact that Vorgan will prefer to place under Terra any intelligent race who are more than conquered slaves. Allies. in a sense. That's because the Loard-vogh have never yet experienced any allving. Their past is devoid of practice. So it will be

with Sscantoo. You will come un-Linzete shrugged. "Win, lose, or draw. Sscantoo seems doomed." "Nonsense! Secantoo will read the benefits of a Galaxy-wide culture. Sscantoo will reap the benefits created by Terra, and without

der our jurisdiction."

the battle scars that Terra will bear forever. Fight them, and you will die. There is little sense in beine dead. Linzete. Never sesin will the Loard-vooth conquer and enslave. From now on in, they will find their selected victims prepared and allying with them, offering them facts and facets of culture, and sponsored by Terra. Terrans are already high in the councils of the Loard-york as technical advisors. They calculate and they advise, and

they will advise terms for this sys-

tem and for that system, and the end-product will be to weld the entire Galaxy into one solid culture.

"Fight them?" laughed Billy. "Why fight them when we can outmaneuver them before the logisticians can cover their first page of

trial equations."

"Trouble is," said Linzete, "that Symutovians are a rather belligerent race, and entirely individualistic. And the Loard-vogh are extreme

militarists "

"Secantoo's job is clear. Secantovians like isloation and lone-wolfing. That's why I am here pleading with you." Billy pointed out of the overhead dome into the bright sky. "Out there, somewhere, there must be another culture that really needs extermination More than half of the Galaxy lies out there. Linzete, take your lifetime and your

planet's resources and go out and find for me a whipping post to keep the Loard-vogh in lighting trim. It's precious little warfare they'll get at home from now on in." Linzete purred. "You seem to have solved our problem and theirs

all in one plan. Terran, it is a "Sscantoo will not be sorry,"

promised Billy. Linzete nodded, and poured a drink from the carafe at his elbow.

"To a united Galaxy," he said. They drank, "Tell me, Billy, what hanpens when you meet a race that will not listen to reason baying planetary defenses too powerful to

"We have a means of rotating a tive thousand mile sphere of their

116

sun's core into subspace. It makes a violent variable out of it, and forces the race to migrate within a year. During migration, of course, they are helpless and they can be handled with ease"

"Um" swallowed Linzete

The color of his face showed that he did see.

Ouce more the months rolled past. The trip was made to Terra in subspace, to save time, but when Billy arrived, his greeting to Pa-

tricia Kennebec was hungry and de-"You'd think it were months." she objected mildly.

"For me it has been," he conferent

Another month rolled by, and it west with a peculiar time-sense, for it was both violently swift at times, and at other times it dragged like eternity. Both of them would have preferred a quick wedding, but position interfered with the process. But the month ended eventually, and after a solid round of formal offairs punctuated by less formal details, they got the right and the opportunity to take to their space-

ship together. And the four months that followed drove past as swiftly as the light-years logged up on the recorder. Theirs was an ambling passage through prime space; they

stopped at four or five intervening systems on their way. Their arrival at Vorgan's capitol

followed the visits from Indan Ko

and Linzete. Billy knew, and ASTOUNDING SCIENCE-PICTION smiled inwardly. He'd planned it

"Stick around," he told her with a grin. "Females are strictly nom de something-or-other in there at present. I'll be out directly." He entered and saluted Vorgan.

Lindoo was less affable than the Lord of All, who smiled.

"A nice piece of said Vorgan.
"Thank you."

Vorgan turned to Lindoo. "You once told me that you would step down when your master at diplomacy came along," he twitted.

Billy smiled at Lindoo. "I gather that I executed your wishes to perfection," he said. Lindoo blinked.

Vorgan turned back to the Terran, "His wishes?"
"Certainly, I admit that I took

liberties with my orders, but I couldn't know whether settling the Seantovian affair without losing a man included Tlembo as well, because by the time I took stock, they were allied, and we of Terna always consider that a confederate rates the same treatment as the prime contractor."

"But I do not understand. Did Vorgan issue any orders?"

"I am responsible to him. I am among his advisory staff. He selected me. It was his ability to select me that puts him in the posi-

lected me. It was his ability to select me that puts him in the position of ordering me." "Proceed" said Vorgan,

"Lord of All, a responsible assistant certainly does not require a written order for every act. Not among Terrans, anyway. A good

supervisor selects assistants who can anticipate and act upon his wishes. A good assistant can act as his superior would act, and knows his superior's wishes. Therefore I was but anticipating Lindoo's plan, and acting in accordance with my knowledge of his desire." Lindoo blinked, and the storm-

cloud of his face cleared. Vorgan smiled slightly. "Keep him." he said. "He will do a lot for you." Lindoo would require a bit more

soothing, Billy knew, but that could come easily and soon enough. He was dismissed and as he left. Ritly smiled inwardly. Let them rule. He and his cohorts would rule the rulers. He had a fairly complete picture right now. They had rid themselves of Sezare the dissolute voluptuary, and Borgara, the tyrant, and there was a sector not too for away where one Terron had convinced the overseer that an experiment in offering the slaves better living quarters and a better future might pay off. It would, for the downtrodden sector against which the model project was stacked knew of the "race" in production and were taking it easy. The model

project's output might even he dou-And several sectors were combing close to locate intelligent assistants and specialists to aid the Terrans-the research sector. And Terrans in large groups were roaming the galactic front, using their ability to speak and communicate with any race. They could enter any system that used a reasonable facsimile of Terran air for an atmosphere, and disease and death did not touch them. Their arguments were brilliant, and they achieved without fighting that which the Loard-york could not do. If the Loard-year felt that things were moving too fast they had but to inspect their birth records. With

less fighting, there was less absence It would be a long, hard-driven road to travel, but it would lead to a united Galaxy. Meanwhile, Billy would be happy without fretting about his position. He was satisfied to advise Lindoo.

of the fighting men-

Vorgan, Emporer of the Loardvogh, Lord of All, and his race fought for the unity of the Galaxy. They still thought they ruled it as they would-

PR OFIT!

"That tenderfoot certainly is wise about some things"

MAYBE he doesn't know a stirrup from a saddle . . . but judging from that glorious Calvert highball, he sure knows his whiskey!

Make no mistake, Calvert is very definitely the real thing in whiskey. Fact is, we've blended more fine whiskey in our time than any other distiller in America
... and that magnificent Calvert blend
has yet to be matched! Moral (and this ig
right from the horse's mouth): It's just
plain horse-sense to make sure your next
highball is made with Calvert.

. . It's the real thing!

Clear Heads Choose Calvert

Calvert Distillers Corp., N. Y. C. BLENDED WHISKEY 86.8 Proof.

Calvert "Reserve"—65% Grain Neutral Spirits... Calvert "Special"—72½% Grain Neutral Spirits
